Hazard, Risk & Vulnerability

$$\text{Risk} = \text{Hazard} * \text{Vulnerability}$$

Nature decided, and can be assessed

Man decided, and can be reduced

$$R = \langle H_i, P_i, C_i \rangle$$

set of i-events with possible adverse consequences

associated probabilities of their occurrence

associated intolerable consequences

Earthquake effects

ground shaking

liquefaction

surface rupture

Hector Mines E/q, USA

tsunami

Any strategy for seismic risk reduction should be outlined trying to answer two basic questions:

- When, where and how big we have to expect a strong earthquake to strike a region?
- What should we expect when it occurs?

The answer to the first question is matter for earthquake prediction,

while the second one is matter for sound seismic (& tsunami) hazard assessment...

SHA Dualism

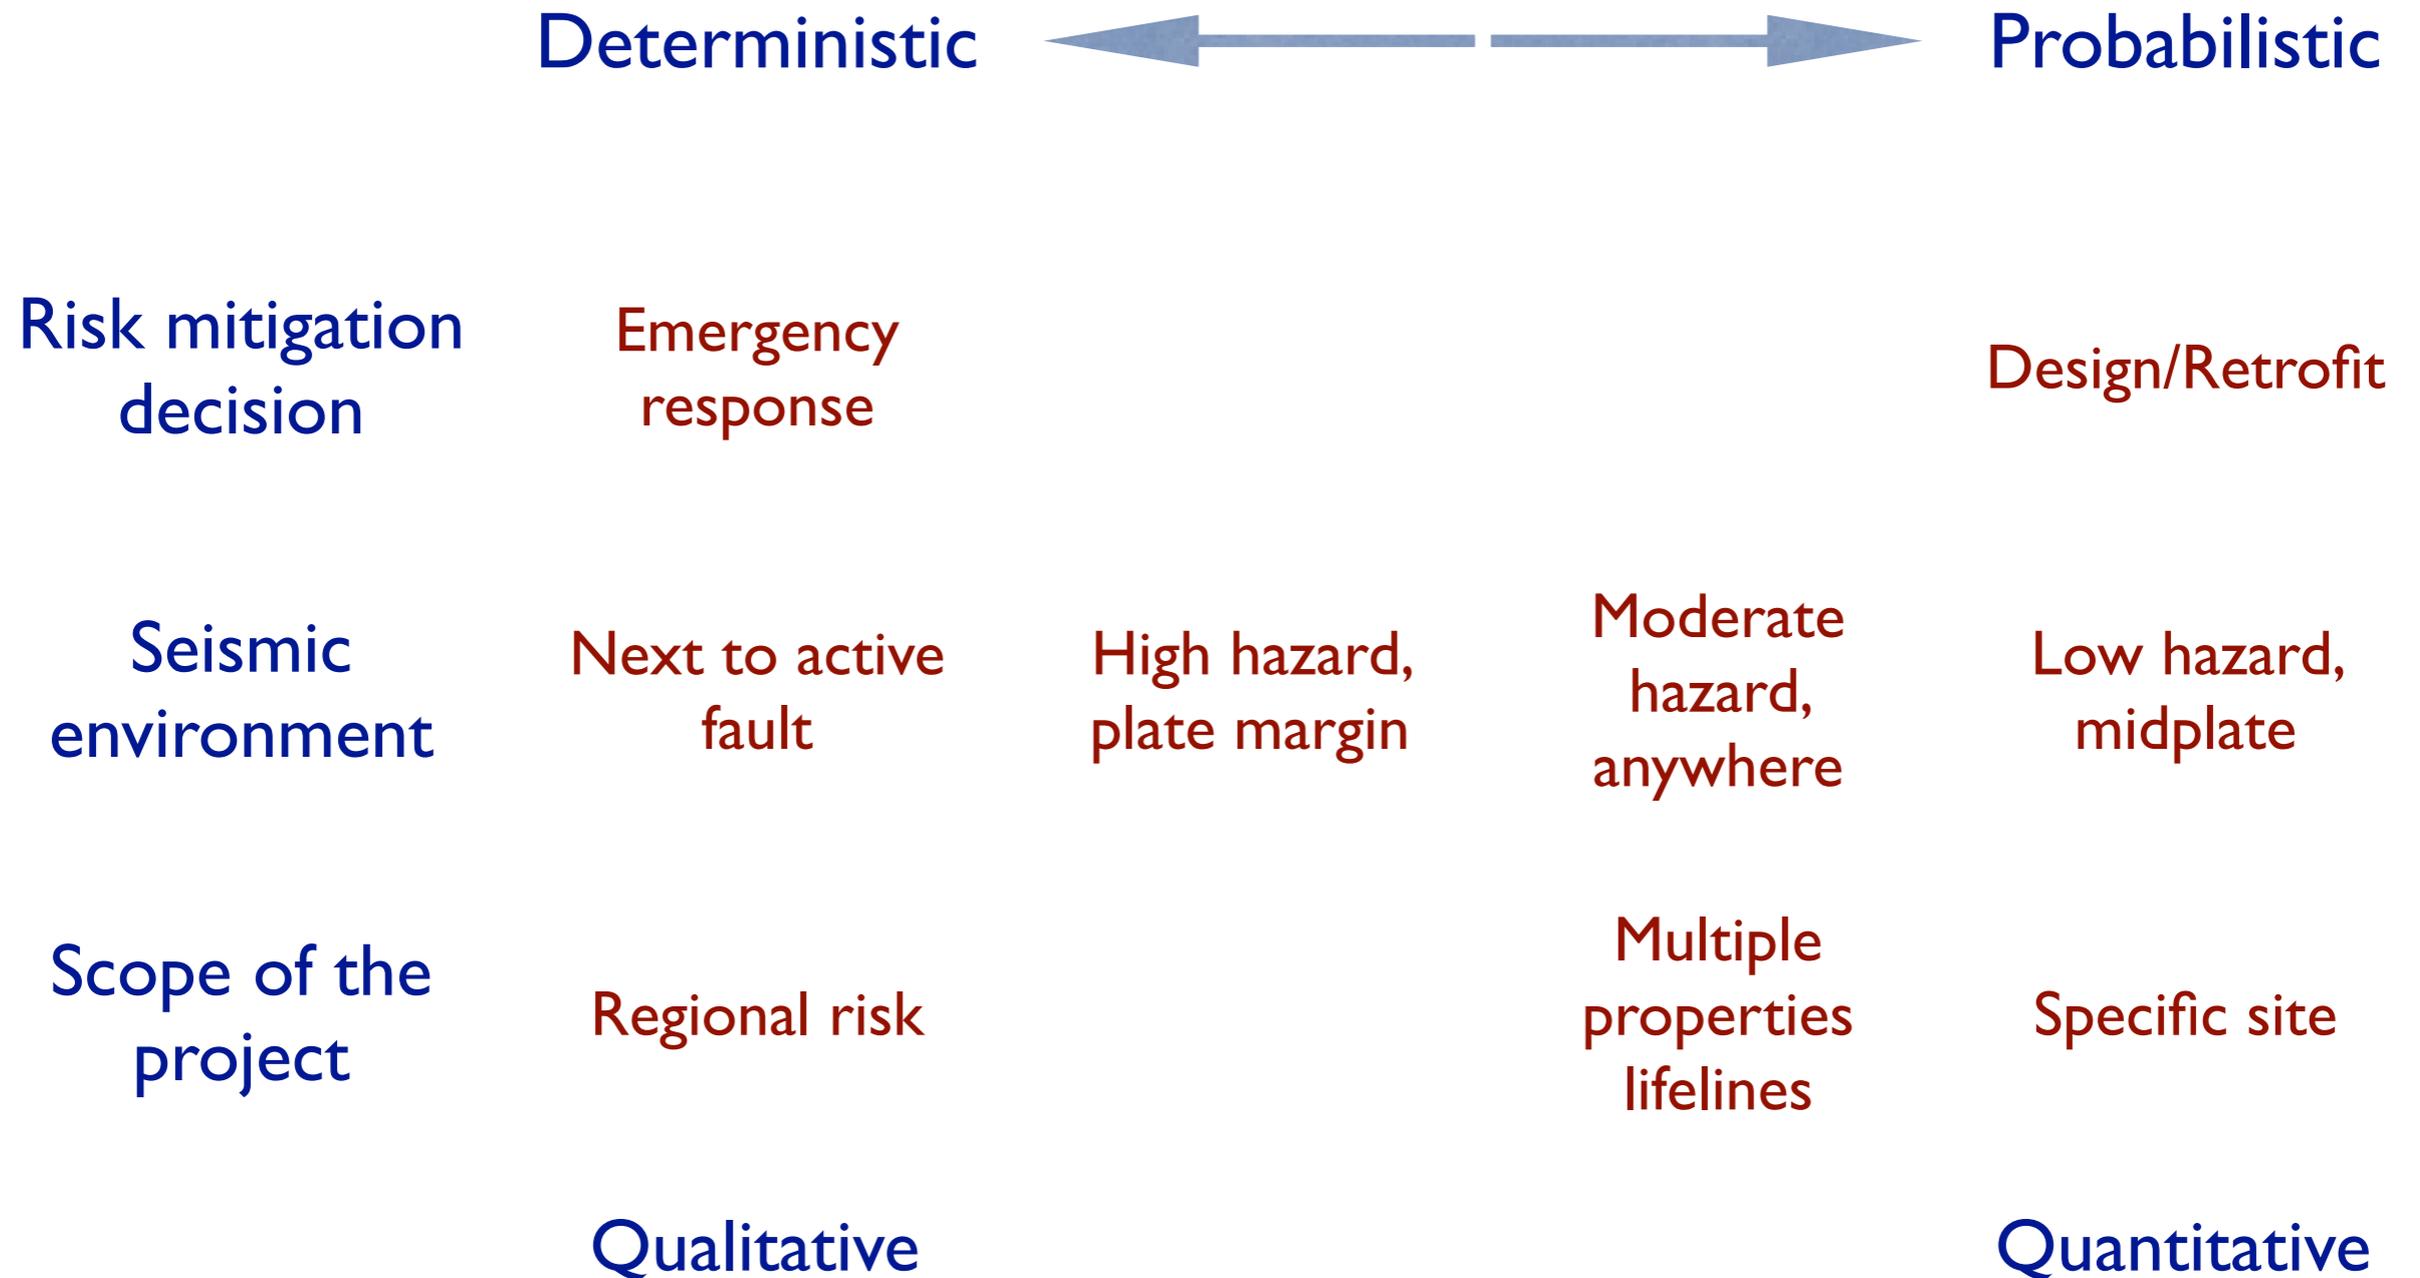

Deterministic vs. probabilistic approaches to assessing earthquake hazards and risks have differences, advantages, and disadvantages that often make the use of one advantageous over the other.

Probabilistic methods can be viewed inclusive of all deterministic events with a finite probability of occurrence. In this context, proper deterministic methods that focus on a single earthquake ensure that that event is realistic, i.e. that it has a finite probability of occurrence.

Determinism vs. probabilism is not a bivariate choice but a continuum in which both analyses are conducted, but more emphasis is given to one over the other. Emphasis here means weight in the decision-making process...

SHA dualism

Modified from: Mc Guire, 2001

Standard global approach

Kobe (17.1.1995), Gujarat (26.1.2001), Boumerdes (21.5.2003) Bam (26.12.2003), E-Sichuan (12.5.2008) and Haiti (12.1.2010) earthquakes PGA(g)

Expected

Observed

with a probability of exceedence of 10%
in 50 years (return period 475 years)

• Kobe	0.40-0.48	0.7-0.8
• Gujarat	0.16-0.24	0.5-0.6
• Boumerdes	0.08-0.16	0.3-0.4*
• Bam	0.16-0.24	0.7-0.8
• E-Sichuan	0.16-0.24	0.6->0.8
• Haiti	0.08-0.16	0.3-0.6

Global Seismic Hazard Assessment Program (GSHAP) was launched in 1992 by the International Lithosphere Program (ILP) with the support of the International Council of Scientific Unions (ICSU), and endorsed as a demonstration program in the framework of the United Nations International Decade for Natural Disaster Reduction (UN/IDNDR). GSHAP terminated in 1999.

*from 1, if liquefaction is considered the value may be smaller
