Parte III

Modulo 3.1 Continental Margin Depositional Processes: down-slope processes

Relatore

Angelo Camerlenghi con materiale di Renata G. Lucchi

rglucchi@ogs.trieste.it

Source-to-sink system

- Siliciclastic continental shelves

- Sedimentary processes on Continental Margins

- Deep Marine Systems

Sedimentary processes on Continental Margins

- Mass Transport Deposition >>>> MTDs

- Turbidity currents >>>> Turbidites

the Source to Sink System

Sedimentary Processes on Continental Margins

down-slope: driven by gravity forces

along-slope: driven by density forces

(thermo-haline or water mass accumulation)

Continental shelf

Preferential area of sediment accumulation
High sediment accumulation

High isostatic subsidence

Continental slope sediment deposition and transfer toward deeper environments

Continental rise: sediment deposition (deep sea fans, sediment drifts)

Siliciclastic continental shelves

Wind/wave dominated shelves
e.g. Mediterranean margins (tides ≤ 3 m)

Tide dominated shelves
e.g. North European margins (tides $\gg 3$ m)

Other sedimentary/biological processes

- Storms sediment resuspension
- sediment bioturbation
- Surface and bottom turbidity currents associated to river output (Hypopycnal and Hyperpycnal flows on deltas and prodeltas)
- Incursions of surface ocean currents on the outer shelf

Deep-Marine Systems

Glacial processes

River processes

Starving areas

HIGH LATITUDE MARGINS (NORTH OF 56° N)
 (diagram shows processes operating in glacial times)

MIDDLE LATITUDE MARGINS (26° -56° N)
 (dominated by canyons and channels)

MIDDLE LATITUDE MARGINS (15° -26° N)
 (dominated by landslide processes)

Sedimentary processes on Continental Margins

Depositional process → **Deposit**

down-slope processes:
 driven by gravity forces

- » Mass Transport Deposition → **MTDs**
- » Turbidity currents → **Turbidites**
- » Riverine outflows → **Hyper (Hypo)- picnites**
- » Turbid meltwaters → **Plumites**
- » Brine-related deposition

along-slope: driven by density forces (thermo-haline origin)

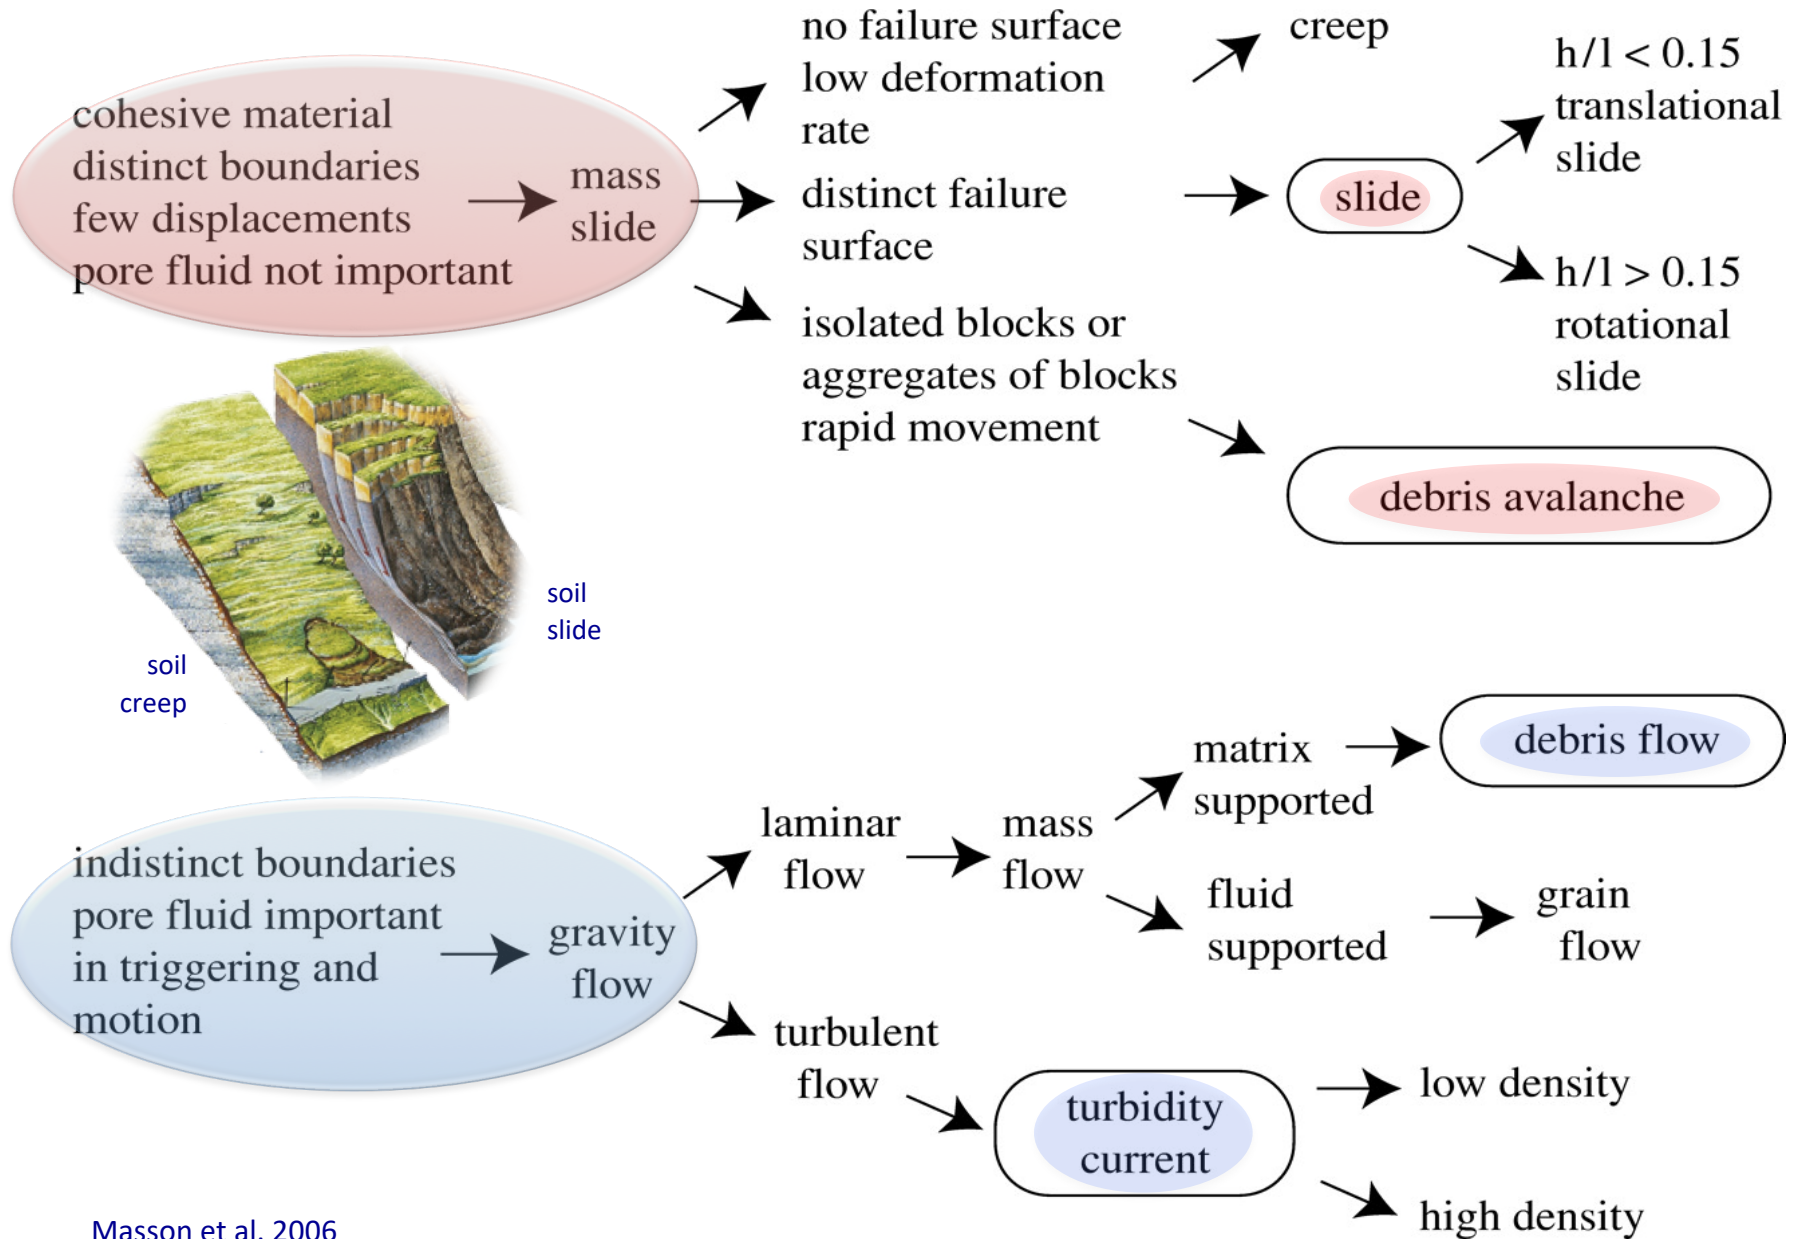

- » Contour currents → **Contourites**

Classification of MTDs (Mass Transport Deposits):

- Reology (sediment deformation)
- Sediment mass mechanism of support (gravity, flow turbulence, grains interaction)
- Physical properties of the mass flow and deposit (sediment disturbance, shear strength, etc.)
- Morphological characteristics of the deposit

Submarine slides/slumps

They are **ubiquitous** features of submarine slopes in all geological settings and at all water depths, particularly in areas where fine grained sediments predominate.

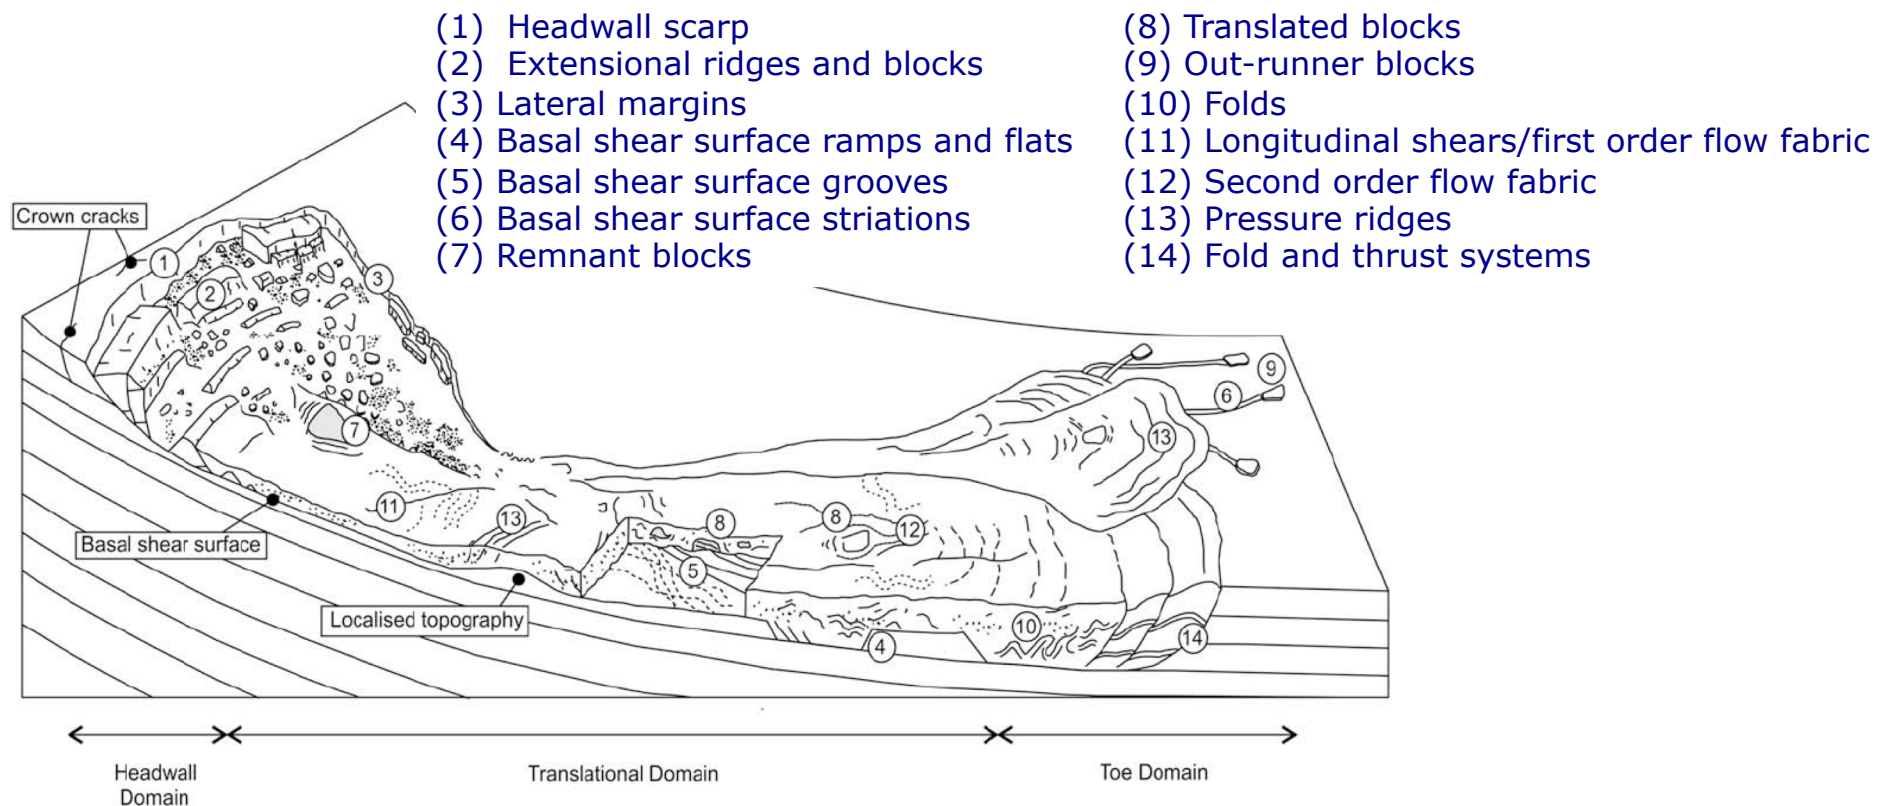

Adapted from Morgan et al., 2009. *Scientific Drilling*, available at: <http://www.iodp.org/geohazards/>

Complexity:

Once failure initiates, the event may **progress by means of a number of mass movement processes**. Although various subdivisions and classification schemes for these processes exist, each process represents part of a continuum, whereby one type may evolve into or trigger another.

Many submarine slope failures are likely to have involved a number of processes, possibly active at different stages of failure. Therefore, it is common that the depositional units resulting from submarine mass movements are defined as **'Mass-Transport Complexes (MTC)'**.

Gravity flows

Debris flows

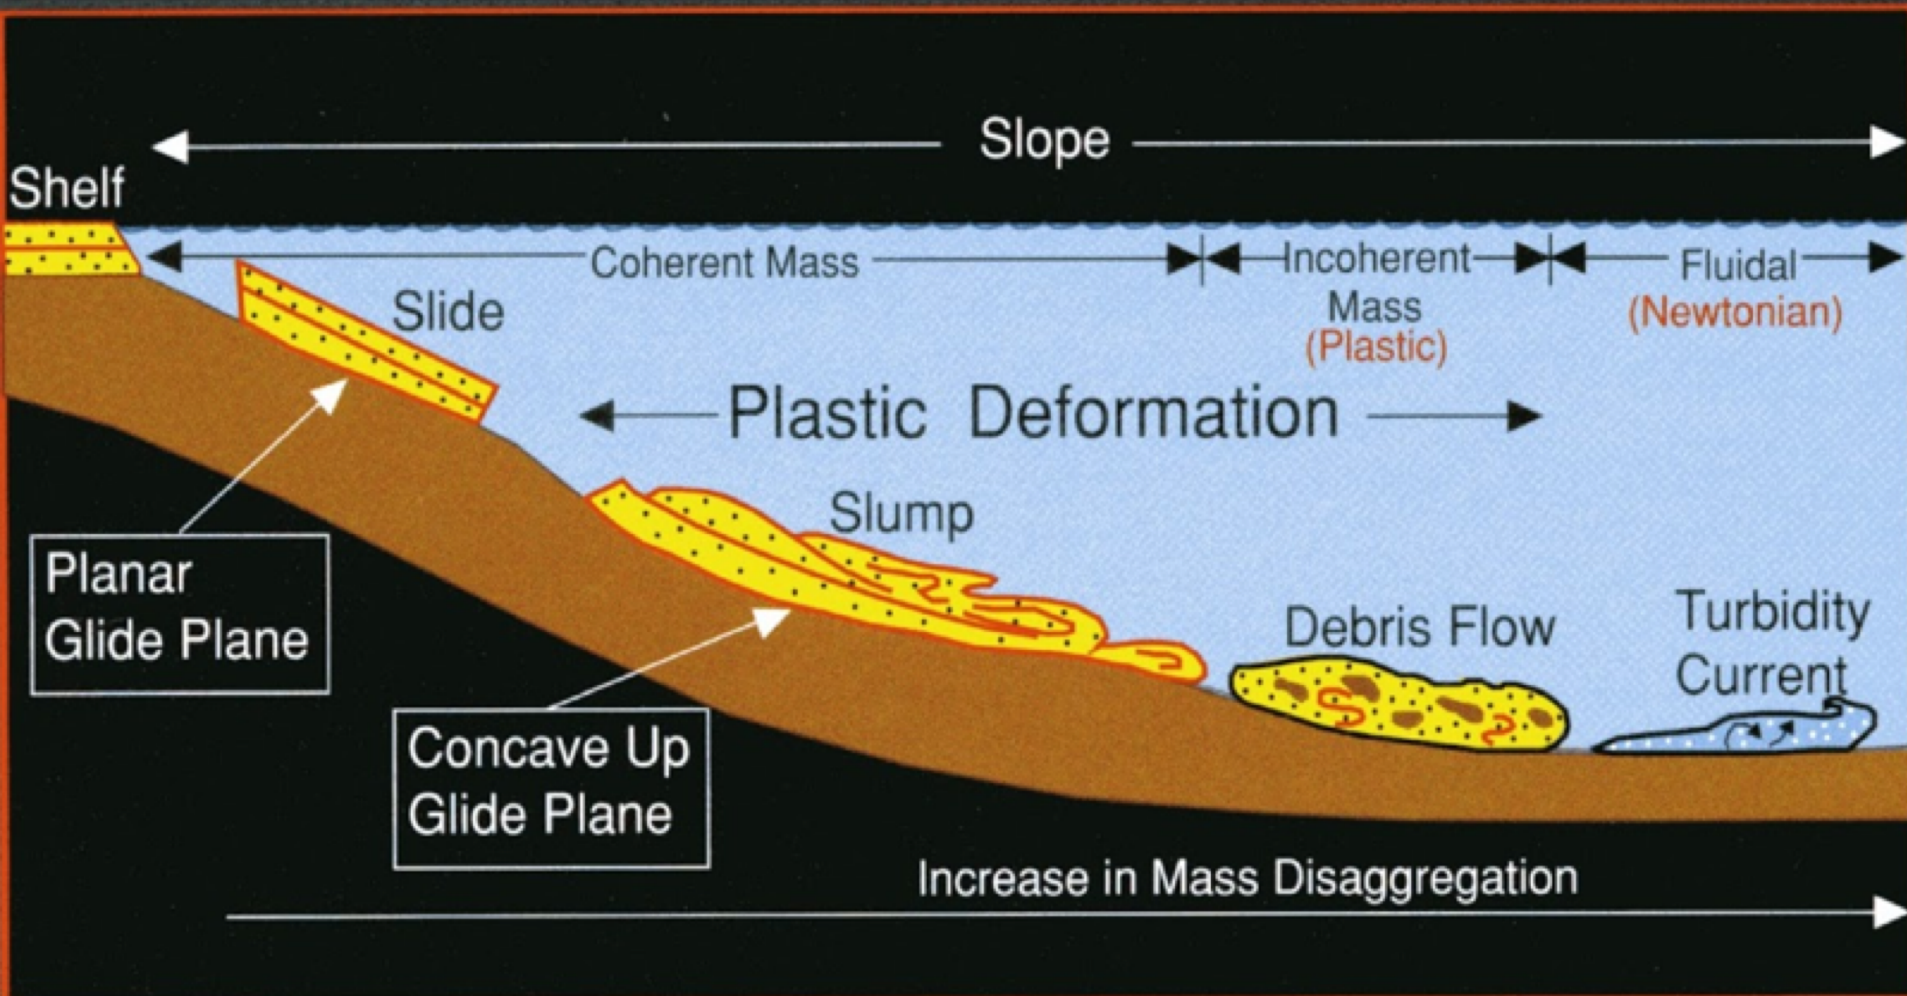

Laminar flux supported by the water-rich muddy matrix

Debris flow: mud/sand >1; pebbles >5%

Mud flow: mud/sand <1; pebbles <5%

Gravity-Driven Downslope Processes in Deep Water

Turbidity flows

Density currents in which the granular support is maintained by the vertical component of the turbulent flux

Turbidity flows

Density currents in which the granular support is maintained by the vertical component of the turbulent flux

TYPE OF EVENT

Long steady flow (e.g. river fed)
Short surge-type (e.g. river floods, slope instability)

FLOW DENSITY

High density (higher velocity) $>1.1 \text{ g/cm}^3$
Low density (lower velocity) $<1.1 \text{ g/cm}^3$

FLOW TRANSFER

Confined (canyon, channel, levee, deep-sea fan)
Unconfined

(after Pickering et al., 1989)

silty turbidites

sandy turbidite

muddy turbidites

MOST COMMON FEATURES

- « Sharp base characterized by sharp grain size change often with sharp color change (careful with sediment oxidation)
- « Planar laminations
- « Bioturbated top

INDICATION OF SHEAR SORTING

Grain size and compositional sorting through the deposit. Sorting occurs according to size and specific weight (e.g. large forams with medium-size quartz with small-size pyroxene)

COMPOSITION

Presence of allocthonous particles e.g. shelf-derived particles in deep-sea environments (typically bryozoa, autigenic glauconite)

Size - Velocity Diagram

Bouma Sequence

SMALL-SCALE BED FORMS: $\lambda < 20 \text{ cm}$				 (adapted from Harms et al. 1982, fig.3.7a)
Bed form	Symmetric small ripples (SSR) regular, 2D, symmetrical, sharp crests, straight flanks, broad troughs	SSR + asymmetric small ripples (ASR) more irregular, 2-2.5D, still symmetrical, rounder crests, some straight and some biconvex flanks	ASR + asymmetric large ripples irregular, 3D, asymmetrical, larger λ and height, round biconvex profiles, pronounced scour on lower end of stoss	Current ripples very irregular, 3D, sharp crests, steep and straight lee, convex-up stoss
Symmetry index	-1.2	-1.5		5-10 (Yokokawa 1995)
Dip of lee side	11-16°		24-27° dip of lee side increases with increasing Uu	- angle of repose (30-35°)
Roundness index	0.44	- 0.50	> 0.50	0.5-0.6 (Yokokawa 1995)
Ripple index	generally between 8-12 for all bed forms			
Orbital diameter/wavelength	8-15	- 8-15	8-15	N/A

antidune formation

bedforms

LARGE-SCALE BED FORMS: $\lambda > 100 \text{ cm}$				 (adapted from Harms et al. 1982, fig.3.10)
Bed form	Symmetric large ripples (SLR) SLR: 2.5D, symmetrical, sharp discontinuous crests = to brink, straight flanks	Hammocky (HM) + SLR + ALR HM: 3D, symmetrical, no brink point, broad round crests, domal, convex-up flanks	Asymmetric large ripples (ALR) ALR: 2D-3D, asymmetrical, brink not always = to crest, round stoss with break in slope, can have scour pits on lower end of stoss	Dunes regular (2D) to irregular (3D), sharp crests, steep and straight lee, straight to convex-up stoss
Symmetry index	- 1.0 (< 1.5)	≤ 2	> 2	-
Dip of lee side	14-24° (SLR), 15-22° reverse large ripples (RLR)		23-31° dip of lee side increases with increasing Uu	- angle of repose (30-35°)
Roundness index	- 0.40-0.50 highest for HM bed forms	- 0.45-0.60	- 0.55-0.75 (up to 0.95)	-
Ripple index	generally between 8-12 for all bed forms			
Orbital diameter/wavelength	1-2	1-2	1-2	N/A

HIGH DENSITY turbidity flows

The *linked debrite*

Confined systems: Canyons and associated deep sea fans

Reflected turbidites and Multi-sources turbidites

DIVISIONS	INTERPRETATION
Homogeneous silty mudstone cap, with scattered load balls near the base	Rapid deposition of mud floccs under ponded suspension
Alternating laminated and pseudonoduled very fine sand and silt in couplets that thin upward	Gradual decay of reversing flow in an enclosed basin, leading to ponding
Wavy and ripple laminated divisions with reverse flow directions and spaced mud partings	multiple reflections and deflections of a single large flow from basin margins. Flow strength and bedform scale decrease exponentially. Mud drapes form between passes of the current
Parallel and/or cross-stratified coarse sand
