

“Complementi di Fisica” ***Lectures 14, 15, 16***

Livio Lanceri
Università di Trieste

Trieste, 29/31-10-2012

In these lectures

- **Contents**

- **Particles: probability density and flux; charge density and current density**
- **Potential energy step: transmission and reflection coefficients**
- **Potential well or barrier: limiting cases (Dirac δ)**

- **Reference textbooks**

- **J.H.Davies, The physics of low-dimensional semiconductors, Cambridge University Press, 1998, p.9-13 (“1.4 Charge and current densities”)**
- **D.A. Neamen, Semiconductor Physics and Devices, McGraw-Hill, 3rd ed., 2003, p.38-42**
- **D. Griffith, ...**

2

“Flux” of particles ?

Particle flux: number of particles crossing a given surface per unit surface and per unit time

Electrical current density: (particle flux) $\times$ (charge/particle)

Relationship with the wave function? Guess based on dimensions:

$$[F] = [\text{cm}^{-2} \text{s}^{-1}]$$

$$[|\Psi|^2 dx dy dz] = [\text{probability}] \quad \text{a - dimensional}$$

$$\Rightarrow [|\Psi|^2] = [L^{-3}] = [\text{cm}^{-3}] = [|A|^2] \quad \Psi = A e^{ikx}$$

$$\text{velocity : } [v] = [L T^{-1}] = [\text{cm s}^{-1}]$$

$$[F] = [|A|^2 v] = [\text{cm}^{-2} \text{s}^{-1}]$$

29/31-10-2012

L.Lanceri - Complementi di Fisica - Lectures 14, 15, 16

3

“Flux” of particles ?

Relationship with the wave function? Guess based on dimensions:

$$[F] = [|A|^2 v] = [\text{cm}^{-2} \text{s}^{-1}]$$

$$F = v A^* A$$

$$[F] = [\text{cm}^{-2} \text{s}^{-1}]$$

“flux of incident particles”

for a wave function with space part:

$$\psi = A e^{ikx}$$

normalization (large but finite volume V) :

$$\int_V |\psi|^2 dV = \int_V |A|^2 dV = \begin{cases} 1 & \text{one particle} \\ N & \text{N particles} \end{cases}$$

29/31-10-2012

L.Lanceri - Complementi di Fisica - Lectures 14, 15, 16

4

Fluxes and Currents

More refined treatment, based on the equation of continuity in electromagnetism:

(flux of current through a closed surface) = - d/dt (charge inside)

$$\oint_S \vec{J} \cdot \vec{n} dS = - \frac{\partial}{\partial t} \oint_V \rho dV$$

$$\vec{\nabla} \cdot \vec{J} = - \frac{\partial \rho}{\partial t}$$

$$\frac{\partial J_x}{\partial x} + \dots = - \frac{\partial \rho}{\partial t}$$

In the simplest 1-d case
the "current density vector"
reduces to a "current" J:

29/31-10-2012

L.Lancieri - Complementi di Fisica - Lectures 14, 15, 16

5

Summary of Classical Physics

Maxwell's equations

I. $\nabla \cdot \vec{E} = \frac{\rho}{\epsilon_0}$ (Flux of $\vec{E}$ through a closed surface) = (Charge inside)/ ϵ_0

II. $\nabla \times \vec{E} = - \frac{\partial \vec{B}}{\partial t}$ (Line integral of $\vec{E}$ around a loop) = $- \frac{d}{dt}$ (Flux of $\vec{B}$ through the loop)

III. $\nabla \cdot \vec{B} = 0$ (Flux of $\vec{B}$ through a closed surface) = 0

IV. $c^2 \nabla \times \vec{B} = \frac{\vec{j}}{\epsilon_0} + \frac{\partial \vec{E}}{\partial t}$ c^2 (Integral of $\vec{B}$ around a loop) = (Current through the loop)/ ϵ_0 + $\frac{\partial}{\partial t}$ (Flux of $\vec{E}$ through the loop)

Conservation of charge

$\nabla \cdot \vec{j} = - \frac{\partial \rho}{\partial t}$ (Flux of current through a closed surface) = $- \frac{\partial}{\partial t}$ (Charge inside)

Force law

$$\vec{F} = q(\vec{E} + \vec{v} \times \vec{B})$$

Law of motion

$\frac{d}{dt}(\vec{p}) = \vec{F}$, where $\vec{p} = \frac{m\vec{v}}{\sqrt{1 - v^2/c^2}}$ (Newton's law, with Einstein's modification)

Gravitation

$$\vec{F} = -G \frac{m_1 m_2}{r^2} \vec{e}_r$$

From: The Feynman Lectures on Physics, vol.II

Continuity and Schrödinger

The wave function is a solution of the Schrödinger equation (1-d for simplicity):

$$i\hbar \frac{\partial}{\partial t} \Psi(x,t) = -\frac{\hbar^2}{2m} \frac{\partial^2}{\partial x^2} \Psi(x,t) + U(x,t) \Psi(x,t)$$

From the QM postulates on the wave function, the charge density must be identified with:

$$\rho \equiv q |\Psi(x,t)|^2$$

Since there is a charge density, there should be also a current J (in general, 3-d: current density vector), satisfying the continuity equation (1-d)

$$\frac{\partial \rho}{\partial t} = -\frac{\partial J_x}{\partial x} \quad \text{where : } J_x(x,t) \equiv ???$$

29/31-10-2012

L.Lancieri - Complementi di Fisica - Lectures 14, 15, 16

7

Continuity and Schrödinger

From the Schrödinger equation to a continuity equation (1-d):

$$i\hbar \Psi^* \frac{\partial}{\partial t} \Psi = -\frac{\hbar^2}{2m} \Psi^* \frac{\partial^2}{\partial x^2} \Psi + U \Psi^* \Psi \quad \Psi^* \times (\text{S.eq.})$$

$$-i\hbar \Psi \frac{\partial}{\partial t} \Psi^* = -\frac{\hbar^2}{2m} \Psi \frac{\partial^2}{\partial x^2} \Psi^* + U \Psi \Psi^* \quad \Psi \times (\text{S.eq.})^*, U \text{ real}$$

$$\frac{\partial}{\partial t} \Psi^* \Psi = -\frac{\hbar}{2im} \left(\Psi^* \frac{\partial^2}{\partial x^2} \Psi - \Psi \frac{\partial^2}{\partial x^2} \Psi^* \right) \quad \text{Subtracting, regrouping: time evolution of } |\Psi|^2$$

$$\frac{\partial}{\partial t} [q \Psi^* \Psi] = -\frac{\partial}{\partial x} \left[\frac{q\hbar}{2im} \left(\Psi^* \frac{\partial}{\partial x} \Psi - \Psi \frac{\partial}{\partial x} \Psi^* \right) \right] \Rightarrow \text{continuity equation (1-d)}$$

Charge density $\rho(x,t)$

Current $J_x(x,t)$

29/31-10-2012

L.Lancieri - Complementi di Fisica - Lectures 14, 15, 16

8

Probability (charge) current density

A few specific examples (easy to verify):

1. **Stationary wave functions:** $\rho = \text{constant}$ $J_x = 0$

2. **Plane waves** $\Psi(x,t) = Ae^{i(kx - \omega t)}$

$$\rho = q|A|^2 = q|\Psi|^2 \quad J_x = \frac{q\hbar k}{m}|A|^2 = q|A|^2 v$$

3. **Superposition of plane waves travelling in opposite directions**

$$\Psi(x,t) = (A_+ e^{ikx} + A_- e^{-ikx}) e^{i\omega t}$$

$$J_x = \frac{q\hbar k}{m} (|A_+|^2 - |A_-|^2)$$

4. **Decaying waves (real exponential for the space part)**

$$\Psi(x,t) = (B_+ e^{Kx} + B_- e^{-Kx}) e^{i\omega t} \quad K \text{ real}$$

$$J_x = \frac{q\hbar K}{im} (B_+^* B_- - B_-^* B_+) = \frac{2q\hbar K}{m} \Im(B_+ B_-)$$

29/31-10-2012

L.Lanceri - Complementi di Fisica - Lectures 14, 15, 16

9

“Step” potential energy barrier

Analysis method

- **Separable solutions: time-independent Schrödinger equation**
 - The energy eigenvalue must be *the same everywhere*; it may correspond to
 - a “bound” particle state
 - a “free” particle state
 - *the energy eigenvalue E determines the type of solution in each region (interval)*
 - *Continuity of the wave function and its derivative, at the boundaries between different intervals, determine the coefficients of the different terms*
- **transmission and reflection coefficients for a given finite *barrier or well* can be defined for “free” particle states**

29/31-10-2012

L.Lanceri - Complementi di Fisica - Lectures 14, 15, 16

11

Solution types

- **If in some region the potential $U(x) = U_0$ is constant: possible separable stationary solutions:**
 - **If $E > U_0$:** $-\frac{\hbar^2}{2m} \frac{d^2\psi}{dx^2} + U_0\psi = E\psi \Rightarrow \frac{d^2\psi}{dx^2} + k^2\psi = 0, \quad k^2 = \frac{2m(E - U_0)}{\hbar^2} > 0$
 $\Rightarrow \psi(x) = Ae^{ikx} + Be^{-ikx}, \quad A \text{ and } B \text{ arbitrary complex constants, or}$
 $\psi(x) = C \sin kx + D \cos kx \quad (\text{equivalent}); \quad k \text{ is real!}$
 - **If $E < U_0$:** $-\frac{\hbar^2}{2m} \frac{d^2\psi}{dx^2} + U_0\psi = E\psi \Rightarrow \frac{d^2\psi}{dx^2} + q^2\psi = 0, \quad q^2 = \frac{2m(E - U_0)}{\hbar^2} < 0$
 $\Rightarrow q = \sqrt{(-1) \frac{2m(U_0 - E)}{\hbar^2}} = i\alpha, \quad \alpha^2 = \frac{2m(U_0 - E)}{\hbar^2} > 0$
 $\Rightarrow \psi(x) = Ae^{\alpha x} + Be^{-\alpha x}, \quad A \text{ and } B \text{ arbitrary complex constants}$

in this case: q imaginary, α real;

equivalent notation: $\frac{d^2\psi}{dx^2} - \alpha^2\psi = 0, \quad \alpha^2 = \frac{2m(U_0 - E)}{\hbar^2} > 0$

29/31-10-2012

L.Lanceri - Complementi di Fisica - Lectures 14, 15, 16

12

Step potential energy, $E > U_0$

$$\begin{aligned}
 I: \quad \psi_I(x) &= A_1 e^{ik_1 x} + B_1 e^{-ik_1 x} & k_1 &= \sqrt{2mE/\hbar^2} \quad \text{real} \\
 II: \quad \psi_{II}(x) &= A_2 e^{ik_2 x} + B_2 e^{-ik_2 x} & k_2 &= \sqrt{2m(E - U_0)/\hbar^2} \quad \text{real}
 \end{aligned}$$

Coefficients: boundary conditions, particles coming from the left

$$I: \quad A_1 = 1 \quad (\text{arbitrary}) \quad B_1 \quad (\text{"reflected"})$$

$$II: \quad A_2 \quad (\text{"transmitted"}) \quad B_2 = 0$$

29/31-10-2012

L.Lanceri - Complementi di Fisica - Lectures 14, 15, 16

13

Step potential energy, $E > U_0$

Wave function and its derivative: continuity at $x = 0$

$$\psi_I(0) = \psi_{II}(0) \Rightarrow 1 + B_1 = A_2$$

$$\left. \frac{d\psi_I}{dx} \right|_{x=0} = \left. \frac{d\psi_{II}}{dx} \right|_{x=0} \Rightarrow ik_1 - ik_1 B_1 = ik_2 A_2$$

The coefficients B_1 , A_2 can be determined in terms of k_1 , k_2 and therefore are uniquely determined by the energy eigenvalue E

$$B_1 = \frac{k_1 - k_2}{k_1 + k_2} = B_1(E) \quad A_2 = \frac{2k_1}{k_1 + k_2} = A_2(E)$$

These coefficients are expressing the relative "weights" of the reflected and transmitted waves: as we have seen, they can be used to find the corresponding "fluxes" or "currents"!

29/31-10-2012

L.Lanceri - Complementi di Fisica - Lectures 14, 15, 16

14

Reflection and transmission, $E > U_0$

Reflection coefficient: ratio of “reflected flux” to “incoming flux”
Reflection probability = fraction of particles “reflected back”

$$R = \frac{v_1 |B_1|^2}{v_1 |A_1|^2} = \frac{|B_1|^2}{|A_1|^2} = \dots = R(E)$$

Transmission coefficient: ratio of “transmitted flux” to “incoming flux”
Transmission probability = fraction of particles “transmitted on”

$$T = \frac{v_2 |A_2|^2}{v_1 |A_1|^2} = \dots = T(E)$$

Exercise:
 compute $R(E)$, $T(E)$
 for an electron
 with $E = 20 \text{ eV}$, $U_0 = 10 \text{ eV}$

Unlike the classical case,
 not all particles with $E > U_0$ “climb” over the step!

29/31-10-2012

L.Lancieri - Complementi di Fisica - Lectures 14, 15, 16

15

Step potential energy, $E < U_0$

$$I: \psi_I(x) = A_1 e^{ik_1 x} + B_1 e^{-ik_1 x} \quad k_1 = \sqrt{2mE}/\hbar \quad \text{real}$$

$$II: \psi_{II}(x) = A_2 e^{\alpha_2 x} + B_2 e^{-\alpha_2 x} \quad \alpha_2 = \sqrt{2m(U_0 - E)}/\hbar$$

($q_2 = i\alpha_2$ imaginary, α_2 real)

Coefficients: boundary conditions, particles coming from the left

$$I: A_1 = 1 \quad (\text{arbitrary}) \quad B_1 \quad (\text{"reflected"})$$

$$II: A_2 = 0 \quad (\text{divergent!!!}) \quad B_2 \quad (\text{"transmitted"??})$$

29/31-10-2012

L.Lancieri - Complementi di Fisica - Lectures 14, 15, 16

16

Step potential energy, $E < U_0$

Wave function and its derivative: continuity at $x = 0$

$$\psi_I(0) = \psi_{II}(0) \quad \Rightarrow \quad 1 + B_1 = B_2 \quad \text{setting } A_1 = 1$$

$$\left. \frac{d\psi_I}{dx} \right|_{x=0} = \left. \frac{d\psi_{II}}{dx} \right|_{x=0} \quad \Rightarrow \quad ik_1 - ik_1 B_1 = -\alpha_2 B_2$$

Solving for the coefficients B_1, B_2 as before:

$$B_1 = -\frac{\alpha_2 + ik_1}{\alpha_2 - ik_1} \quad |B_1|^2 = 1$$

$$B_2 = -\frac{2ik_1}{\alpha_2 - ik_1} \quad |B_2|^2 = 4 \frac{k_1^2}{\alpha_2^2 + k_1^2}$$

The “reflection” R seems to be total: same weight as the incoming wave, with a phase shift

“Transmission” T is not zero: the wave function “leaks” at $x > 0$!?!

Exercise:
compute $R(E), T(E)$
defined as before

29/31-10-2012

L.Lancieri - Complementi di Fisica - Lectures 14, 15, 16

17

Step potential energy, $E < U_0$

Non-zero probability for the particle to be found at $x > 0$
(classically impossible!);

The corresponding probability density $P(x)$ is:

$$P(x) = |\psi_{II}(x)|^2 = |B_2|^2 e^{-2\alpha_2 x} \quad \alpha_2 = \sqrt{2m(U_0 - E)/\hbar^2}$$

Exercise 1:

Evaluate the typical “penetration depth” $L = 1/(2\alpha)$
For an electron with $E = 8$ eV and a step $U_0 = 10$ eV

Exercise 2:

Evaluate the probability (with the above data) that
an electron is found at a distance $> L$ from the
position of the step:

$$p(x \geq L) = \int_L^{+\infty} P(x) dx = \dots$$

However, the net flux for $x > 0$ is zero
(can be checked by computing the current density)
and eventually the particle must turn back !

29/31-10-2012

L.Lancieri - Complementi di Fisica - Lectures 14, 15, 16

18

Limiting cases: Dirac δ

Dirac δ “function”: potential energy well

Bound particle solution

Free (scattering) solution

Reflection and transmission coefficients

Similar results for potential barrier

Dirac δ “function”

- “Generalized function” concept

- You can think of it as a “limit” case in a family of functions (for instance gaussians)

- Integral = unity

- Decreasing width, increasing max. value

$$\begin{aligned} a &\rightarrow 0 \\ b &\rightarrow \infty \\ ab &= 1 \end{aligned}$$

$$\delta(x) = \begin{cases} 0 & x \neq 0 \\ \infty & x = 0 \end{cases}$$

$$\int_{-\infty}^{+\infty} \delta(x) dx = 1$$

- Extending the definition of integrals, one can show that:

$$f(x)\delta(x-a) = f(a)\delta(x-a)$$

$$\int_{-\infty}^{+\infty} f(x)\delta(x-a) dx = f(a)$$

Dirac δ potential

- Represent wells or barriers in a simplified way:

The product of U_0 (barrier "height") and a (barrier "width") represents the "strength" α of the interaction, determining transmission probability etc.

29/31-10-2012

L.Lancieri - Complementi di Fisica - Lectures 14, 15, 16

21

δ -potential well: bound states ($E < 0$)

Time-independent S.eq.

$$-\frac{\hbar^2}{2m} \frac{d^2\psi}{dx^2} - \alpha \delta(x) \psi = E \psi$$

Separable solutions: look for wave functions ψ and energy eigenvalues E

$$I(x < 0): U(x) = 0 \Rightarrow \frac{d^2\psi}{dx^2} + \frac{2mE}{\hbar^2} \psi = 0$$

$$\psi_I(x) = A e^{-Kx} + B e^{+Kx} \quad K^2 = -\frac{2mE}{\hbar^2} > 0$$

$II(x < 0):$ Exclude divergent terms: $A = D = 0$

$$\psi_I(x) = C e^{-Kx} + D e^{+Kx}$$

29/31-10-2012

L.Lancieri - Complementi di Fisica - Lectures 14, 15, 16

22

δ-potential well: bound states ($E < 0$)

To find allowed values for E
and B, C, K : continuity conditions.

(a) Wave function continuity.

$$\lim_{x \rightarrow 0^-} \psi_I(x) = \lim_{x \rightarrow 0^+} \psi_{II}(x) \Rightarrow B = C$$

$$\Rightarrow \psi(x) = B e^{-K|x|} = \begin{cases} B e^{Kx} & x \leq 0 \\ B e^{-Kx} & x \geq 0 \end{cases}$$

(b) First derivative: discontinuous at $x = 0$, where the potential has a singularity. The Schr. eq. constrains the difference of the limits of the first derivatives, as it can be seen integrating on $[-\epsilon, +\epsilon]$ and taking the limit for $\epsilon \rightarrow 0$

$$-\frac{\hbar^2}{2m} \int_{-\epsilon}^{+\epsilon} \frac{d^2\psi}{dx^2} dx - \alpha \int_{-\epsilon}^{+\epsilon} \delta(x) \psi(x) dx = E \int_{-\epsilon}^{+\epsilon} \psi(x) dx$$

29/31-10-2012

L.Lancieri - Complementi di Fisica - Lectures 14, 15, 16

23

δ-potential well: bound states ($E < 0$)

Integrating we obtain:

$$-\frac{\hbar^2}{2m} \left[\frac{d\psi}{dx} \right]_{-\epsilon}^{+\epsilon} - \alpha \psi(0) = E \int_{-\epsilon}^{+\epsilon} \psi(x) dx$$

↓
0

In the limit $\epsilon \rightarrow 0$

$$-\frac{\hbar^2}{2m} \left[\frac{d\psi}{dx} \right]_{-\epsilon}^{+\epsilon} - \alpha \psi(0) = E \int_{-\epsilon}^{+\epsilon} \psi(x) dx$$

$$\frac{d\psi}{dx} \Big|_{x=0^+} - \frac{d\psi}{dx} \Big|_{x=0^-} = -\frac{2m\alpha}{\hbar^2} \psi(0)$$

$$-KB - KB = -\frac{2m\alpha}{\hbar^2} B$$

(dis)continuity constrains therefore K and E to only one possible value:

$$K = \frac{m\alpha}{\hbar^2} \Rightarrow E = -\frac{\hbar^2 K^2}{2m} = -\frac{m\alpha^2}{2\hbar^2}$$

29/31-10-2012

L.Lancieri - Complementi di Fisica - Lectures 14, 15, 16

24

δ-potential well: bound states ($E < 0$)

The only missing parameter B is determined by the normalization condition:

$$\int_{-\infty}^{+\infty} |\psi(x)|^2 dx = 1$$

$$2 \int_0^{+\infty} |B|^2 e^{-2Kx} dx = \frac{|B|^2}{K} = 1$$

$$\Rightarrow B = \sqrt{K} = \frac{\sqrt{m\alpha}}{\hbar}$$

⇒ Only one bound solution:

$$\psi(x) = \frac{\sqrt{m\alpha}}{\hbar} e^{-m\alpha|x|/\hbar^2} \quad E = -\frac{m\alpha^2}{2\hbar^2}$$

29/31-10-2012

L.Lanceri - Complementi di Fisica - Lectures 14, 15, 16

25

δ-potential well: free states ($E > 0$)

Time-independent S.eq.

$$-\frac{\hbar^2}{2m} \frac{d^2\psi}{dx^2} - \alpha\delta(x)\psi = E\psi$$

Separable solutions: look for wave functions ψ and energy eigenvalues E

$$I: x < 0 \quad \psi_I(x) = Ae^{ikx} + Be^{-ikx} \quad k = \frac{\sqrt{2mE}}{\hbar} > 0 \quad \text{real}$$

$$II: x > 0 \quad \psi_{II}(x) = Fe^{ikx} + \cancel{Ge^{-ikx}}$$

$$G = 0$$

Particles coming
From the left

(Dis)continuity at $x = 0$

$$\psi_I(0) = \psi_{II}(0): \quad A + B = F$$

$$\left. \frac{d\psi_{II}}{dx} \right|_{0^+} - \left. \frac{d\psi_I}{dx} \right|_{0^-} = -\frac{2m\alpha}{\hbar^2} \psi(0)$$

$$ik(F - A + B) = -\frac{2m\alpha}{\hbar^2} (A + B)$$

$$B = \frac{-\beta}{\beta + i} A \quad \beta = \frac{m\alpha}{\hbar^2 k}$$

$$F = \frac{1}{1 - i\beta} A$$

29/31-10-2012

L.Lanceri - Complementi di Fisica - Lectures 14, 15, 16

26

Reflection and transmission

reflection coefficient

$$R \equiv \frac{\text{reflected flux}}{\text{incoming flux}} = \frac{v|B|^2}{v|A|^2} = \frac{\beta^2}{1+\beta^2} = \dots \quad \beta \equiv \frac{m\alpha}{\hbar^2 k}$$

$$= \frac{1}{1 + \hbar^4 k^2 / (m^2 \alpha^2)} = \frac{1}{1 + 2\hbar^2 E / (m\alpha^2)} = R(E)$$

transmission coefficient

$$T \equiv \frac{\text{transmitted flux}}{\text{incoming flux}} = \frac{v|F|^2}{v|A|^2} = \frac{1}{1+\beta^2} = \dots$$

$$= \frac{1}{1 + m^2 \alpha^2 / (\hbar^4 k^2)} = \frac{1}{1 + 2m\alpha^2 / (2\hbar^2 E)} = T(E) \quad R + T = 1$$

29/31-10-2012

L.Lanceri - Complementi di Fisica - Lectures 14, 15, 16

27

δ -potential barrier

identical solution method, but:

- no bound solution
- only $E > 0$, "scattering" solutions
- the reflection and transmission coefficients $R(E)$ and $T(E)$ have the same expressions

29/31-10-2012

L.Lanceri - Complementi di Fisica - Lectures 14, 15, 16

28

Lectures 13-15: summary

- In these lectures we learned:
 - How to represent the charge density (proportional to the probability density) and the current density, in terms of the wave function
 - To find the separable solutions of the Schrödinger equation, (the allowed energy eigenvalues and the corresponding eigenfunctions) for a potential energy varying in steps with intervals in which it can be considered constant
 - In particular, we treated in detail the simplest cases:
 - Single potential step
 - δ -function wells and barriers
- (Computing in particular *transmission* and *reflection coefficients*)

29/31-10-2012

L.Lancieri - Complementi di Fisica - Lectures 14, 15, 16

29

Lectures 14-16: exercises

1. Compute the current densities in the special cases listed at p.8
2. Compute the transmission and reflection coefficients $R(E)$, $T(E)$ for an electron with kinetic energy $E = 20$ eV, crossing a potential energy step $U_0 = 10$ eV
3. Evaluate the typical “penetration depth” $L = 1/(2\alpha)$ for an electron with $E = 8$ eV and a step $U_0 = 10$ eV
4. Evaluate the probability (with the above data) that an electron is found at a distance $> L$ from the position of the step
5. Compute the reflection and transmission coefficients for an electron with energy $E = 10$ eV crossing a barrier approximated with $U(x) = \alpha \delta(x)$, where $\alpha = 20$ eV Å

29/31-10-2012

L.Lancieri - Complementi di Fisica - Lectures 14, 15, 16

30

Back-up slides

Finite potential barrier

“bound” particle

“free” particle

Reflection and transmission
coefficients

Tunnel effect

(NB: this section is given for reference only)

Finite potential barrier - introduction

- $E > U_0$: wavelength always real;
 - But: there is usually reflection in addition to transmission!
- $E < U_0$: wavelength becomes imaginary (analog to classical: “evanescent waves”);
 - the wave function falls off exponentially in the barrier
 - There is a “transmitted” wave with reduced amplitude

29/31-10-2012

L.Lancieri - Complementi di Fisica - Lectures 14, 15, 16

33

Finite barrier: (a) solutions

Similar to finite well, but we use slightly different notations: to describe both “bound” and “free” solutions with the same equations, here q may be real or imaginary depending on the sign of $E - U_0$

$$I: \psi_I = e^{ikx} + B_1 e^{-ikx}$$

$$k = \sqrt{2mE/\hbar^2}$$

$$II: \psi_{II} = A_2 e^{iqx} + B_2 e^{-iqx}$$

$$q = \sqrt{(E - U_0)2m/\hbar^2}$$

$$III: \psi_{III} = A_3 e^{ikx}$$

$$k = \sqrt{2mE/\hbar^2}$$

29/31-10-2012

L.Lancieri - Complementi di Fisica - Lectures 14, 15, 16

34

Reflection and transmission

Continuity conditions:

$$\begin{aligned}
 x = -a : \quad & e^{-ika} + B_1 e^{ika} = A_2 e^{-ika} + B_2 e^{ika} \\
 & ike^{-ika} + (-ik)B_1 e^{ika} = iqA_2 e^{-ika} - iqB_2 e^{ika} \\
 x = a : \quad & A_2 e^{ika} + B_2 e^{-ika} = A_3 e^{ika} \\
 & iqA_2 e^{ika} - iqB_2 e^{-ika} = ikA_3 e^{ika}
 \end{aligned}$$

4 equations for 4 unknowns: A_2, B_2, B_1, A_3 ; we are interested mainly in reflection and transmission probabilities, represented by $|B_1|^2$ and $|A_3|^2$, where B_1 and A_3 are given by (see details in back-up slides):

$$\begin{aligned}
 B_1 &= \frac{i(q^2 - k^2) \sin(2qa)}{2kq \cos(2qa) - i(k^2 + q^2) \sin(2qa)} e^{-2ika} \\
 A_3 &= \frac{2kq}{2kq \cos(2qa) - i(k^2 + q^2) \sin(2qa)} e^{-2ika}
 \end{aligned}$$

“free” solution for $E > U_0$

- **By inspection of the equations for R and T , their features for $E > U_0$:**
 - B_1 and A_3 are complex numbers (“probability amplitudes”)
 - B_1 is not zero, even for $E > U_0$
 - $B_1 \rightarrow 0$ for $U_0 \rightarrow 0$
 - $|B_1| \leq 1$
 - $|B_1|^2 + |A_3|^2 = R + T = 1$
 - $R = |B_1|^2$ and $T = |A_3|^2$ can be interpreted respectively as *probabilities for reflection and transmission of the particle by the potential barrier* (see coefficients defined previously for the step potential)
- **A similar method is used in more complicated 3-d problems found in the physics of semiconductors !**
 - For instance, scattering of an electron by an impurity or defect in a crystal lattice...
 - computation of “scattering amplitudes” and “probabilities” !

“tunneling” solution for $E < U_0$

• When $E < U_0$:

- Classically, the particle can only bounce back (perfect reflection)
- Here: non-zero transmission probability
- Convenient to show explicitly that q becomes purely imaginary

$$q^2 = \frac{2m}{\hbar^2} (E - U_0) < 0 \Rightarrow \text{express it as } q = i\eta \text{ purely imaginary}$$

$$\eta^2 = \frac{2m}{\hbar^2} (U_0 - E) > 0$$

$$\cos(2qa) \rightarrow \frac{e^{-2\eta a} + e^{2\eta a}}{2}$$

$$\sin(2qa) \rightarrow \frac{i(e^{2\eta a} - e^{-2\eta a})}{2}$$

$$A_3 = \frac{4ik\eta e^{-2\eta a}}{2ik\eta(1 + e^{-4\eta a}) + (k^2 - \eta^2)(1 - e^{-4\eta a})} e^{-2ika}$$

$$e^{-4\eta a} \ll 1 \Rightarrow T = |A_3|^2 \approx \frac{16k^2\eta^2}{(k^2 + \eta^2)^2} e^{-4\eta a}$$

37

“tunneling” solution for $E < U_0$

Exponentially decreasing “tunneling” (transmission) probability, depending on the interaction strength, product of η (barrier “height”) and a (barrier “width”):

$$e^{-4\eta a} \ll 1 \Rightarrow T = |A_3|^2 \approx \frac{16k^2\eta^2}{(k^2 + \eta^2)^2} e^{-4\eta a}$$

η = barrier “height”
 a = barrier “width”

Qualitatively similar behavior for arbitrary barrier shape, with more complicated coefficients in the exponential, obtained by integrating over many “thin square barriers”
