INFORMATION QUALITY

- It is easy to implement references databanks using available ICTs and web technologies
- **Bibliography databanks refer only to quality information**
- Scientific papers to be published need to be:
 - ✓ Peer-reviewed to obtain the comments from expert colleagues
 - ✓ If the comments are all positive, the paper is accepted
 - ✓ If the comments are negative →
 - ✓ Request for paper revision (major/minor)
 - ✓ Reject
 - ✓ After the revision
 - ✓ New review
 - ✓ Direct acceptance/rejection

SCIENTIFIC PAPER ARCHITECTURE

Signal processing

ABSTRACT

Background: The web-based systems available for multi-centre clinical trials do not combine clinical data collection (Electronic Health Records, EHRs) with signal processing storage and analysis tools. However, in pathophysiological research, the correlation between clinical data and signals is crucial for uncovering the underlying neurophysiological mechanisms. A specific example is the investigation of the mechanisms of action for Deep Brain Stimulation (DBS) used for Parkinson's Disease (PD); the neurosignal recorded from the DBS target structure and clinical data must be investigated.

Objective: The aim of this study is the development and testing of a new system dedicated to a multi-centre study of Parkinson's Disease that integrates biosignal analysis tools and data collection in a shared and secure environment.

Methods: We designed a web-based platform (WebBioBank) for managing the clinical data and biosignals of PD patients treated with DBS in different clinical research centres. Homogeneous data collection was ensured in the different centres (Operative Units, OUs). The anonymity of the data was preserved using unique identifiers associated with patients (ID BAC). The patients' personal details and their equivalent ID BACs were archived inside the corresponding OU and were not uploaded on the web-based platform; data sharing occurred using the ID BACs. The system allowed researchers to upload different signal processing functions (in a .dll extension) onto the web-based platform and to combine them to define dedicated algorithms.

Results: Four clinical research centres used WebBioBank for 1 year. The clinical data from 58 patients treated using DBS were managed, and 186 biosignals were uploaded and classified into 4 categories based on the treatment (pharmacological and/or electrical). The user's satisfaction mean score exceeded the satisfaction threshold.

Conclusions: WebBioBank enabled anonymous data sharing for a clinical study conducted at multiple centres and demonstrated the capabilities of the signal processing chain configuration as well as its effectiveness and efficiency for integrating the neurophysiological results with clinical data in multi-centre studies, which will allow the future collection of homogeneous data in large cohorts of patients.

Reviewer Recommendation Term:	Major Revision			
Manuscript Rating Question(s):				
Please rate on a scale of 1-3 whether the Highlights are a meaningful and accurate representation of the article. 1 = Meaningful; 2 = Not Meaningful; 3 = Not Provided. For more information, see www.elsevier.com/highlights			Scale	Rating
			[1-3]	N/A
Please rate on a scale of 1-3 whether the Graphical Abstract is a meaningful and an accurate representation of the article. 1 = Meaningful; 2 = Not Meaningful; 3 = Not Provided. For more information, see www.elsevier.com/graphicalabstracts			[1-3]	N/A
Comments to Editor:	<p>REVIEWER: Please indicate to the Editor whether any of the following apply, by deleting 'Y' or 'N' as appropriate:</p> <ul style="list-style-type: none"> * The writing needs substantial improvement - grammar and spelling Y * Improper formatting was used (figures, tables, legends too small) N * The work is too incremental compared to authors' or others' prior work N * The manuscript is for the most part previously published by the authors N * The study is too biological and not quantitative/computational enough N <p>Dear Editor, I read the manuscript and I believe that it worths to let the authors re-revise it. It still have a language problem (I can tell it even though I am not a native English speaker) and I totally agree with the other reviewer that it still lacks the contextualization and comparison with the other approaches. I don't agree, conversely, on the fact that it lacks novelty. It is anyway a different and simpler way to treat the problem of skin reflection, and it could be useful for the imaging community. I would suggest to let them revise it. With kind regards,</p> <p>Sara</p>			
Comments to Author:	<p>The paper "A Novel Dual Calibration Confocal Imaging for Microwave Early Breast Tumor detection in MR Images Based Model" describes a dual calibration technique for microwave breast tumour detection. The model is based on 3D breast MR images and uses a uniformly spaced moving antenna array. The method is described in details and the simulation model is valuable. Also, the figures are informative and well presented in the text.</p> <p>I have two major critiques related to the manuscript:</p> <ol style="list-style-type: none"> 1- the language needs a deep revision from a native English speaker. There are many grammar and syntax mistakes (e.g., in the highlights, "Confocal algorithm use ..." should be "The confocal algorithm uses..."; in the introduction "Mammography and magnetic resonance imaging (MRI) are most common" should be "Mammography and magnetic resonance imaging (MRI) are the most common"). 2- even though the authors describe the available literature on the current state of the art of artefact removal techniques, they do not explain why the proposed methodology differs from the others and how it contributes to overcome the current limitations. Despite the detailed "Methods" and "Results" sections, the manuscript completely lacks the discussion of the results in the light of the current state-of-the-art. The "Conclusions" just provide a summary of the results and do not contextualize the authors' findings. 			

THE DECISION LETTER

22-Feb-2015

Dear Dr. Marceglia:

Manuscript ID ACI-2014-12-RA-0115 entitled "A Standards-Based Architecture Proposal for Integrating Patient mHealth Apps to Electronic Health Record Systems" which you submitted to the Applied Clinical Informatics, has been reviewed. The comments of the reviewer(s) and Associate Editor (if applicable) are included at the bottom of this letter.

The reviewer(s) have recommended publication with Minor Revisions to your manuscript. Therefore, I invite you to respond to the reviewer(s)' comments and revise your manuscript.

The revised manuscript must be UNBLINDED and must contain a section on Human Subject Research Approval and a section on Conflict of Interest.

We encourage you to revise your manuscript within the next 3 weeks to optimize turn-around. Revisions received more than 8 weeks from the date of the decision letter will be considered new submissions, subject to a full round of reviews.

Please log into <https://mc.manuscriptcentral.com/acij> and enter your Author Center, where you will find your manuscript title listed under "Manuscripts with Decisions." Under "Actions," click on "Create a Revision." Your manuscript number has been appended to denote a revision. You will be unable to make your revisions on the originally submitted version of the manuscript. Instead, revise your manuscript using a word processing program and save it on your computer. Please also highlight the changes to your manuscript within the document by using the track changes mode in MS Word or by using bold or colored text. Once the revised manuscript is prepared, you can upload it and submit it through your Author Center. When submitting your revised manuscript, you will be able to respond to the comments made by the reviewer(s) in the space provided. You can use this space to document any changes you make to the original manuscript. In order to expedite the processing of the revised manuscript, please be as specific as possible in your response to the reviewer(s).

While Applied Clinical Informatics focuses on the applied aspects of informatics, we aim to give our readers some methodological background as well. In our experience, Methods of Information in Medicine (<http://www.schattauer.de/en/magazine/subject-areas/journals-a-z/methods.html>) is useful in providing such theoretical background and we encourage references to this journal where appropriate.

IMPORTANT: Your original files are available to you when you upload your revised manuscript. Please delete any redundant files before completing the submission. Because we are trying to facilitate timely publication of manuscripts submitted to the Applied Clinical Informatics, your revised manuscript should be uploaded as soon as possible. If it is not possible for you to submit your revision in a reasonable amount of time, we may have to consider your paper as a new submission.

Once again, thank you for submitting your manuscript to the Applied Clinical Informatics and I look forward to receiving your revision.

Sincerely,

Dr. Christoph Lehmann
Editor in Chief, Applied Clinical Informatics
culehmann@gmail.com

Comments to the Author
In reading this, I had several considerations.

The communication between the mobile application and EHR are encrypted and deidentified, using only a patient ID (which I assume is random). Does the mobile application itself include the patient's name, physician's name, etc.? If someone were to find the mobile device, then easy deduction can allow one to discover the patient's name and medical condition. I know your paper says you do not store health information on the device, but this was left a little unclear to me. Does the application have password or TouchID validation to abate this? Additionally, at what point is the information re-identified, and how is this done? It seems that the logical place would be on the EMR side, but this is not apparent in the paper.

Since no health information is stored on the mobile device, how does this contribute to patient health information tracking? Would these data (which are stored in the multiple repositories, per Figure 2A/B) then be accessible to the mobile platform for longitudinal tracking? As it stands, communication looks to be only one-way in terms of this.

WHO WE ARE

The National Institutes of Health (NIH), a part of the U.S. Department of Health and Human Services, is the nation's medical research agency — making important discoveries that improve health and save lives.

The NIH Director

Francis S. Collins, M.D., Ph.D., was officially sworn in on August 17, 2009, as the 16th director of the NIH.

NIH Leadership

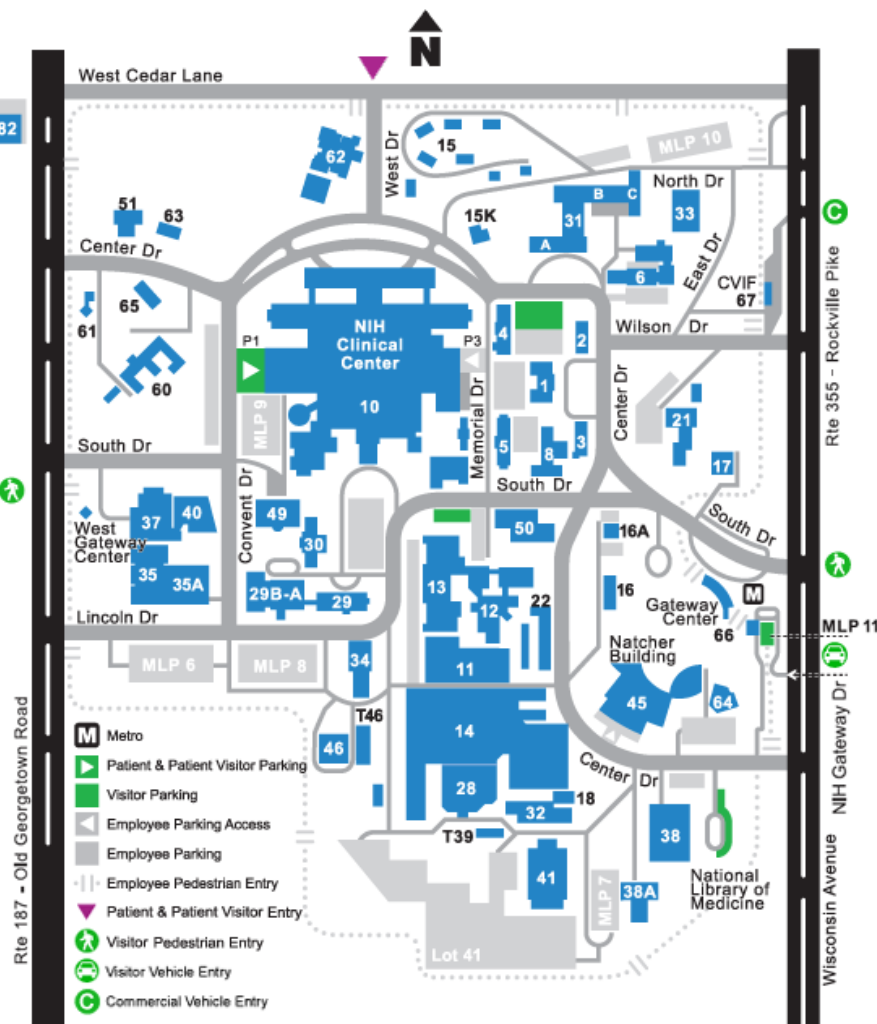

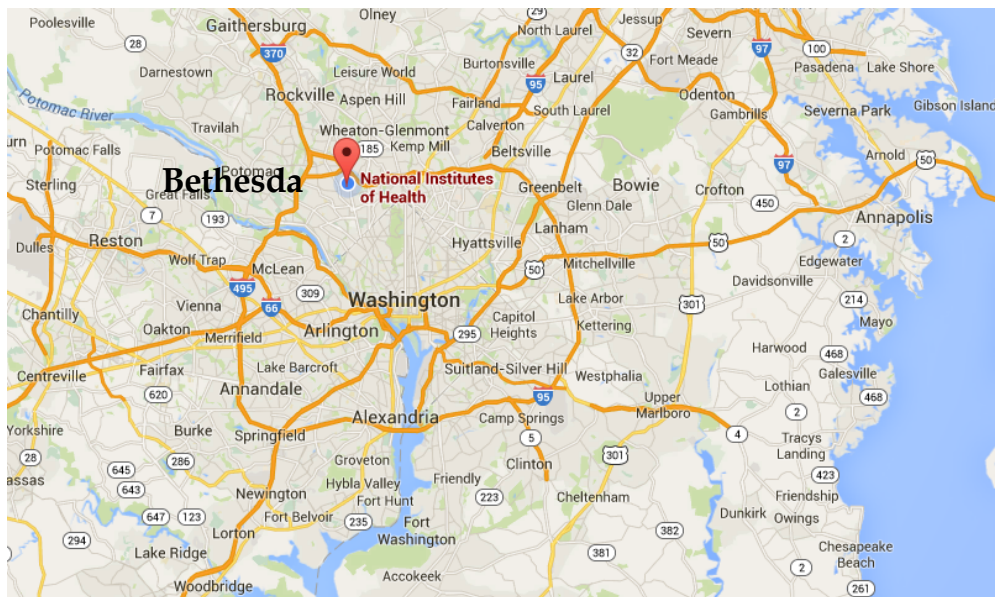

NIH leadership plays an active role in shaping the agency's research planning, activities, and outlook.

Organization

The NIH is made up of 27 different components called Institutes and Centers.

NATIONAL LIBRARY OF MEDICINE
Founded in 1836 as the Library of the Surgeon-General's Office, United States Army+developed as a national resource under the leadership of John Shaw Billings, Librarian from 1865 to 1895+ named Army Medical Library in 1922, and Armed Forces Medical Library in 1952+ made a part of the Public Health Service of the Department of Health, Education, and Welfare in 1956+established on this site in 1961, the one hundred and twenty-fifth anniversary of its founding.

NLM history: 1836-1862

- The National Library of Medicine began as a few books in the office of the Surgeon General of the Army.
- In 1840 the office issued its first "catalogue of books in the library."
- As historian Wyndham D. Miles noted in his 1982 history of NLM, "The entire collection [as listed in that 1840 catalog] could have been held by a four-shelf bookcase, shoulder high and 7 or 8 feet wide."

NLM history: 1862-1866

Riggs Bank Building 15th Street and Pennsylvania Avenue, NW

- the Surgeon General's library was moved to the Riggs Bank Building
- Lieutenant John Shaw Billings transformed the collection into the world's greatest medical library

NLM history: 1866-1887

Ford's Theatre 513 10th Street, NW

In 1879, Billings began the first comprehensive index of journal articles, the Index Medicus: today we know it as MEDLINE

NLM history: 1887-1962

Army Medical Museum and Library Building 7th Street and Independence Avenue, SW

In 1922 the Library of the Surgeon General's Office was officially renamed the Army Medical Library

A 1956 act of Congress transferred the library to the Public Health Service and named it the **National Library of Medicine**

NLM 1962 - today

NLM at the NIH campus: 8600 Rockville Pike, Bethesda, 20894 MD

Designed to protect the collection from possible Cold War threats, the building features foot-thick limestone walls, over 50 miles of subterranean bookshelves and a collapsible roof.

PubMed Overview

MEDLINE

[MEDLINE](#) is the NLM's premier bibliographic database that contains references to journal articles in the life sciences with a concentration on biomedicine. A distinctive feature of MEDLINE is that the records are indexed with NLM's [Medical Subject Headings](#) (MeSH). The database contains citations from [1950 to the present](#), with some older material. New citations that have been indexed with MeSH terms, publication types, GenBank accession numbers, and other indexing data are available daily (Tuesday through Saturday) and display with the tag [PubMed - indexed for MEDLINE]. See also the [MEDLINE/PubMed Resources Guide](#).

MEDLINE/PUBMED

PubMed Overview

Introduction

PubMed, available via the NCBI [Entrez retrieval system](#), was developed by the [National Center for Biotechnology Information \(NCBI\)](#) at the [National Library of Medicine \(NLM\)](#), located at the [U.S. National Institutes of Health \(NIH\)](#). Entrez is the text-based search and retrieval system used at NCBI for services including PubMed, Nucleotide and Protein Sequences, Protein Structures, Complete Genomes, Taxonomy, OMIM, and many others. PubMed provides access to citations from biomedical literature. [LinkOut](#) provides access to full-text articles at journal Web sites and other related Web resources. PubMed also provides access and links to the other Entrez molecular biology resources.

Fact Sheet

What's the Difference Between MEDLINE® and PubMed®?

MEDLINE/PUBMED

- MEDLINE®
- National Library of Medicine® (NLM®) journal citation database.
- Started in the 1960s, it now provides over 21 million references to biomedical and life sciences journal articles back to 1946.
- MEDLINE includes citations from over 5,600 scholarly journals published around the world.
- Publishers submit journals to an NIH-chartered advisory committee, the Literature Selection Technical Review Committee (LSTRC), which reviews and recommends journals for MEDLINE.
- The MEDLINE database is directly searchable from NLM as a subset of the PubMed® database as well as through other numerous search services that license the data.

PUBMED

- Has been available since 1996 (now 23 mln references)
- Include the MEDLINE database plus the following types of citations:
 - In-process citations, which provide records for articles before those records go through quality control and are indexed with MeSH or converted to out-of-scope status.
 - Citations to articles that are out-of-scope from certain MEDLINE journals (general science and general chemistry journals)
 - "Ahead of Print" citations .
 - Citations that precede the date that a journal was selected for MEDLINE indexing and Pre-1966 citations.
 - Citations to some additional life sciences journals that submit full text to PMC[®] (PubMed Central[®]) and receive a qualitative review by NLM.
 - Citations to author manuscripts of articles published by NIH-funded researchers and Citations for the majority of books available on the NCBI Bookshelf .

PUBMED CENTRAL (PMC)

- Launched in 2000
- Free archive for full-text biomedical and life sciences journal articles.
- Repository for journal literature deposited by participating publishers, as well as for author manuscripts that have been submitted in compliance with the NIH Public Access Policy and similar policies of other research funding agencies.
- Although free access is a requirement for PMC deposit, publishers and individual authors may continue to hold copyright on the material in PMC and publishers can delay the release of their material in PMC for a short period after publication.
- There are reciprocal links between the full text in PMC and corresponding citations in PubMed.

Integrating mobile technology with routine dietetic practice: the case of myPace for weight management.

Harricharan M¹, Gemen R², Celemín LF², Fletcher D³, de Looy AE⁴, Wills J², Barnett J².

⊕ Author information

Abstract

The field of Mobile health (mHealth), which includes mobile phone applications (apps), is growing rapidly and has the potential to transform healthcare by increasing its quality and efficiency. The present paper focuses particularly on mobile technology for body weight management, including mobile phone apps for weight loss and the available evidence on their effectiveness. Translation of behaviour change theory into weight management strategies, including integration in mobile technology is also discussed. Moreover, the paper presents and discusses the myPace platform as a case in point. There is little clinical evidence on the effectiveness of currently available mobile phone apps in enabling behaviour change and improving health-related outcomes, including sustained body weight loss. Moreover, it is unclear to what extent these apps have been developed in collaboration with health professionals, such as dietitians, and the extent to which apps draw on and operationalise behaviour change techniques has not been explored. Furthermore, presently weight management apps are not built for use as part of dietetic practice, or indeed healthcare more widely, where face-to-face engagement is fundamental for instituting the building blocks for sustained lifestyle change. myPace is an innovative mobile technology for weight management meant to be embedded into and to enhance dietetic practice. Developed out of systematic, iterative stages of engagement with dietitians and consumers, it is uniquely designed to complement and support the trusted health practitioner-patient relationship. Future mHealth technology would benefit if engagement with health professionals and/or targeted patient groups, and behaviour change theory stood as the basis for technology development. Particularly, integrating technology into routine health care practice, rather than replacing one with the other, could be the way forward.
