Anno accademico 2019/2020

Argomenti

Le superfici di limitazione degli ostacoli

Orientamento delle piste

Dati di riferimento di un aerodromo

Manovre di decollo e atterraggio e Lunghezza pista

Caratteristiche geometriche delle runway (planimetriche e altimetriche)

Distanze di separazione nella circolazione a terra

Caratteristiche geometriche delle uscite dalle runway e delle holding bay

Caratteristiche geometriche delle taxiway e manovre di taxing

Esercizio sulle piste di volo

Area terminale

Superfici limiti degli ostacoli

Superficie orizzontale e conica

RUNWAY CLASSIFICATION										
Surface and dimensions ^a (1)	Non-instrument				Non-precision approach			Precision approach category		
	Code number				Code number			I		II or III
	2	3	4		1,2	3	4	1,2	3,4	3,4
	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)
CONICAL										
Slope	5%	5%	5%	5%	5%	5%	5%	5%	5%	5%
Height	35 m	55 m	75 m	100 m	60 m	75 m	100 m	60 m	100 m	100 m
INNER HORIZONTAL										
Height	45 m	45 m	45 m	45 m	45 m	45 m	45 m	45 m	45 m	45 m
Radius	2 000 m	2 500 m	4 000 m	4 000 m	3 500 m	4 000 m	4 000 m	3 500 m	4 000 m	4 000 m

The plan view diagram shows a central runway strip with an 'Approach' section on the left and a 'Take-off climb' section on the right. The strip is flanked by 'Inner approach' and 'Strip' areas. Surrounding the strip are concentric circles representing 'Inner horizontal' and 'Conical' surfaces. Section lines A-A and B-B are indicated.

Section A-A shows a cross-section of the runway with an 'Approach' section on the left, a 'Conical' section, an 'Inner horizontal' section, a 'Transitional' section, and a 'Take-off climb' section on the right. Section B-B shows a cross-section with an 'Approach' section, a 'Conical' section, an 'Inner horizontal' section, and an 'Inner approach' section.

Slope	5%	4%	2% ^d

- All dimensions are measured horizontally unless specified otherwise.
- The take-off climb surface starts at the end of the clearway if the clearway length exceeds the specified distance.
- 1 800 m when the intended track includes changes of heading greater than 15° for operations conducted in IMC, VMC by night.
- See 4.2.24 and 4.2.26.

Superfici PANS – OPS (1)

Superfici PANS – OPS (2)

- The funnel is formed by the set of 7 surfaces:
- The W and two X approach surfaces.
 - The "footprint" A.
 - The missed approach surface Z.
 - The two Y transitional surfaces.

Dati di riferimento di un aerodromo

Punto di riferimento

Altitudine aerodromo e piste

Temperatura di riferimento

Dimensioni e informazioni aerodromo

Distanze dichiarate

Le manovre di decollo (1)

Le manovre di decollo (2)

Figura 10. 6: Legge del moto dell'aeromobile in fase di decollo in condizioni normali (a) ed in caso di avaria ad un motore (b).

La salita di decollo

Le manovre di avvicinamento (1)

Le manovre di avvicinamento (2)

Le manovre di atterraggio

Le distanze dichiarate

TORA (Take-Off Run Available, corsa di decollo disponibile) lunghezza di pista dichiarata disponibile e adatta alla corsa a terra di un aereo che decolla;

TODA (Take-Off Distance Available, distanza di decollo disponibile) TORA + clearway se esistente;

ASDA (Accelerate Stop Distance Available, distanza di accelerazione ed arresto disponibile) TORA + stopway se esistente;

LDA (Landing Distance Available, distanza di atterraggio disponibile) lunghezza di pista dichiarata disponibile e adatta per un aereo in fase di atterraggio;

Le distanze richieste (1)

TOD (Take-Off Distance) è la maggiore delle seguenti distanze:

- Distanza orizzontale compresa fra il punto di partenza per il decollo ed il punto in cui un aeromobile con il motore critico inoperativo alla V_1 raggiunge con la sua parte più bassa la quota di 35 piedi (10,7 m);**
- La stessa distanza del punto “a”, con tutti i motori operativi, incrementata del 15 %.**

TOR (Take-Off Run) è la maggiore delle seguenti distanze:

- Distanza orizzontale compresa fra il punto di partenza ed il punto intermedio fra il punto di distacco (V_{LO} Velocità di Lift-Off) ed il punto finale di decollo (quota di 35 piedi), nel caso di avaria al motore critico in corrispondenza di V_1 ;**
- La stessa distanza del punto “a” con tutti i motori operativi, incrementata del 15%.**

Le distanze richieste (2)

ASD (Accelerate-Stop Distance) è la distanza compresa tra il punto di inizio decollo ed il punto di completo arresto del veivolo, nel caso di avaria al raggiungimento della velocità V_1 .

Le distanze richieste (3)

LDR (Landing Distance Required) Metodo A: è la maggiore delle seguenti distanze:

- distanza orizzontale necessaria in configurazione di atterraggio, con angolo di discesa 3° e con tutti i motori operativi per fermarsi su pista bagnata a partire da un punto alto 10,7 m sulla superficie di atterraggio, incrementata del 15 %;**
- La stessa distanza del punto “a” ipotizzando il motore critico inoperativo, incrementata del 10 %.**

LDR (Landing Distance Required) Metodo B:

- Su pista asciutta è costituita dalla distanza orizzontale necessaria per atterrare e fermarsi a partire da 15 metri in corrispondenza della soglia, incrementata del 67 %.**
- Su pista bagnata si ottiene la LDR incrementando del 15% il valore su pista asciutta precedente**

Compatibilità tra distanze richieste e dichiarate (1)

TOR < TORA

TOD < TODA

ASD < ASDA

LDR < LDA

Compatibilità tra distanze richieste e dichiarate (2)

La dinamica del volo

$$P = \frac{1}{2} \cdot C_p \cdot \rho \cdot S_a \cdot v^2 \quad R = \frac{1}{2} \cdot C_r \cdot \rho \cdot S_m \cdot v^2$$

$$Q = P = \frac{1}{2} \cdot C_{p,d} \cdot \rho \cdot S_a \cdot v_d^2 = \frac{1}{2} \cdot C_{p,c} \cdot \rho \cdot S_a \cdot v_c^2$$

$$C_{p,d} \cdot v_d^2 = C_{p,c} \cdot (3,5 \cdot v_d)^2$$

$$\frac{C_{p,d}}{C_{p,c}} = (3,5)^2 = 12,25$$

Lo spazio di decollo (1)

$$R_{\text{aer.}} = \frac{1}{2} \cdot C_r \cdot \rho \cdot S_m \cdot v^2$$

$$R_{\text{rot.}} = f_{\text{rot.}} \cdot \left(Q - \frac{1}{2} \cdot C_p \cdot \rho \cdot S_a \cdot v^2 \right)$$

$$R = R_{\text{aer.}} + R_{\text{rot.}}$$

$$T - R = \frac{Q}{g} \cdot a$$

$$ds = v \cdot dt = v \cdot \frac{dv}{a}$$

$$S_1 = \int_{v=0}^{v_R} \frac{v}{a} \cdot dv$$

Lo spazio di decollo (2)

$$S_1 = \int_{v=0}^{v_R} \frac{v}{a} \cdot dv$$

$$S_2 = v_m \cdot t_m$$

$$S_3 = 10,7 \cdot \text{tg}(3^\circ)$$

$$v_m = \frac{v_R + v_2}{2}$$

$$t_m \cong 3 \text{ [s]}$$

Fattori che influenzano lo spazio di decollo

$$Q = P = \frac{1}{2} \cdot C_p \cdot \rho_0 \cdot S_a \cdot v_0^2 = \frac{1}{2} \cdot C_p \cdot \rho_h \cdot S_a \cdot v_h^2$$

$$v_h = \frac{v_0}{\sqrt{\frac{\rho_h}{\rho_0}}} = \frac{v_0}{\sqrt{\delta}}$$

TABELLA V.1 - Aria: tipo internazionale (unità tecniche)

Quota campo m	Temperatura media °C	Pressione mm (Hg)	Peso specifico γ kg _p /m ³	Densità ρ kg _p /m ³	Densità relativa $\delta = \rho/\rho_0$
0	15	760	1,2250	0,1249	1
500	11,75	715,9	1,1673	0,1190	0,9528

3000	-4,50	525,8	0,9091	0,0927	0,7421

$$L_{\text{real.}} = L_{\text{base}} K1 * K2 * K3$$

$$K1 = 1 + 0,07 * (H/300)$$

$$K2 = 1 + 0,01 * (T_R - T_S)$$

$$K3 = 1 + 0,1 * (i)$$

$$T_S = 15 - 0,0065 * H$$

Esempio di calcolo

$L_{\text{base}} = 1700 \text{ m};$ **Quota aeroporto: $H = 150 \text{ m};$**

Temperatura di riferimento $T_R = 24 \text{ }^\circ$ **Pendenza media pista $i = 0,5 \text{ } \%$**

$T_S = 15 - 0,0065 * H = 14,025 \text{ }^\circ$

$$L_{\text{real.}} = L_{\text{base}} * K1 * K2 * K3 = 1700 * 1,035 * 1,100 * 1,050 \cong 2033$$

$$K1 = 1 + 0,07 * (H/300) = 1 + 0,07 * (150/300) = 1,035$$

$$K2 = 1 + 0,01 * (T_R - T_S) = 1 + 0,01 * (24 - 14,025) = 1,100$$

$$K3 = 1 + 0,1 * (i) = 1 + 0,1 (0,5) = 1,050$$

Lo spazio di atterraggio

$$S_1 = 15 \cdot \operatorname{tg}(3^\circ)$$

$$S_2 = v_m \cdot t_m$$

$$Q = m \cdot g = \frac{1}{2} \cdot C_p \cdot \rho \cdot S_a \cdot v_a^2$$

$$\frac{Q}{g} \cdot \frac{dv}{dt} = - \left[f \cdot Q + \frac{1}{2} (C_r - f \cdot C_p) \cdot \rho \cdot S_a \cdot v^2 \right]$$

$$ds = v \cdot dt = v \cdot \frac{dv}{a}$$

$$\frac{v}{g} \cdot \frac{dv}{ds} = - \left[f + \left(\frac{C_r}{C_p} - f \right) \cdot \frac{v^2}{v_a^2} \right]$$

$$\mu = \frac{C_r}{C_p}$$

$$S_3 = \frac{\ln \frac{f}{\mu}}{2 \cdot (f - \mu) \cdot g} \cdot v_a^2$$

Take-off runway	30 m	40 m	75 m	75 m

a. If a holding bay, taxi-holding position or road-holding position is at a lower elevation compared to the threshold, the distance may be decreased 5 m for every metre the bay or holding position is lower than the threshold, contingent upon not infringing the inner transitional surface.

b. This distance may need to be increased to avoid interference with radio navigation aids, particularly the glide path and localizer facilities. Information on critical and sensitive areas of ILS and MLS is contained in Annex 10, Volume I, Attachments C and G to Part I, respectively (see also 3.11.5).

Esercitazione (1)

USO DEI DIAGRAMMI DI PRESTAZIONE PER IL CALCOLO DELLA LUNGHEZZA DI PISTA AL DECOLLO E ALL'ATTERRAGGIO

DATI:

Lunghezza pista: 3000 m

Quota di riferimento dell'aeroporto: 12,5 m s.l.m

Temperatura di riferimento dell'aeroporto: 28,6 ° C

Pendenza longitudinale della pista. Vedi profilo allegato

AEREI	Peso al decollo [kg]	Peso all'atterraggio [kg]	Velocità in soglia [km/h]
MD80	67.000	55.000	250
ATR42	14.500	-	200
BAE 146/300	44.000	38.000	200

DETERMINARE: Lunghezza base sella pista; Classe ICAO dell'aeroporto; verificare il profilo in funzione della classe ICAO; Distanze dichiarate; distanze richieste per ogni aereo; verifica delle uscite per i vari aerei;

^fIncluding clearances of 20 ft wing tip to wing tip; nose to building: 30 ft, groups A and B; 20 ft, groups C and D; 10 ft, groups E and F.

^dIncluding clearances of 20 ft to other aircraft and GSE, 45 ft.

¹1 ft = 0.3048 m.

^dLength and width are based on the largest dimension in the group of aircraft.

Dimensioni degli stalli e manovre (2)

$$B = D * \text{sen}(A) - S$$

$$F = D * \text{sen}(A) - (a + R)$$

$$m = 2 * R - D$$
