# Study on the EU's list of Critical Raw Materials (2020)

Final Report

### **EXECUTIVE SUMMARY**

### Context

Pressure on resources will increase - due to increasing global population, industrialisation, digitalisation, increasing demand from developing countries and the transition to climate neutrality with metals, minerals and biotic materials used in low-emission technologies and products. OECD forecasts that global materials demand will more than double from 79 billion tonnes today to 167 billion tonnes in 2060. Global competition for resources will become fierce in the coming decade. Dependence of critical raw materials may soon replace today's dependence on oil.

The EU Green Deal Communication<sup>1</sup> adopted on 11 December 2019 recognizes access to resources as a strategic security question to fulfil its ambition towards 2050 climate neutrality and increasing our climate ambition for 2030.

Secure and sustainable supply of both primary and secondary raw materials, in particular of critical raw materials, for key technologies and strategic sectors as renewable energy, e-mobility, digital, space and defence is one of the pre-requisites to achieve climate neutrality. The new Industrial Strategy for the EU<sup>2</sup> addresses the security and sustainability challenge and calls for an Action Plan on Critical Raw Materials and for industry-driven raw materials alliances.

This continues the work of the Commission to address the growing concern of securing valuable raw materials for the EU economy. Already in 2008, the European Commission launched the Raw Materials Initiative (RMI)<sup>3</sup>. This EU policy pursues a diversification strategy for securing non-energy raw materials for EU industrial value chains and societal well-being. Diversification of supply concerns reducing dependencies in all dimensions – by sourcing of primary raw materials from the EU and third countries, increasing secondary raw materials supply through resource efficiency and circularity, and finding alternatives to scarce raw materials.

One of the priority actions of the RMI was to establish a list of critical raw materials at EU level. The first list was published in 2011 and it is updated every three years to regularly assess the criticality of raw materials for the EU. Critical raw materials are considered to be those that have high economic importance for the EU and a high supply risk.

The present study is the fourth technical assessment of critical raw materials for the EU, based on the methodology<sup>4</sup> developed by the European Commission in cooperation with the Ad hoc Working Group on Defining Critical Raw Materials (AHWG)<sup>5</sup> in 2017.

The first assessment (2011) identified 14 critical raw materials (CRMs) out of the 41 non-energy, non-agricultural candidate raw materials. In the 2014 exercise, 20 raw materials were identified as critical out of 54 candidates. In 2017, 27 CRMs were identified among 78 candidates.

### Novelties of the 2020 assessment

The 2020 assessment covers a larger number of materials: 83 individual materials or 66 candidate raw materials comprising 63 individual and 3 grouped materials (ten individual heavy rare earth elements (REEs), five light REEs, and five platinum-group metals (PGMs)). Five new materials (arsenic, cadmium, strontium, zirconium and hydrogen) have been assessed.

<sup>&</sup>lt;sup>5</sup> The AHWG on Defining Critical Raw Materials is a sub-group of the Raw Materials Supply Group expert group.

| Industrial and construction minerals | aggregates, baryte, bentonite, borates, diatomite, feldspar, fluorspar, gypsum, kaolin clay, limestone, magnesite, natural graphite, perlite, phosphate rock, phosphorus, potash, silica sand, sulphur, talc                 |
|--------------------------------------|--|
| Iron and ferro-<br>alloy metals      | chromium, cobalt, manganese, molybdenum, nickel, niobium, tantalum, titanium, tungsten, vanadium   |
| Precious metals                      | gold, silver, and Platinum Group Metals (iridium, palladium, platinum, rhodium, ruthenium)   |
| Rare earths                          | Heavy rare earths (dysprosium, erbium, europium, gadolinium, holmium, lutetium, terbium, thulium, ytterbium, yttrium); Light rare earths (cerium, lanthanum, neodymium, praseodymium and samarium); and scandium             |
| Other non-ferrous metals             | aluminium, antimony, arsenic, beryllium, bismuth, cadmium, copper, gallium, germanium, gold, hafnium, indium, lead, lithium, magnesium, rhenium, selenium, silicon metal, silver, strontium, tellurium, tin, zinc, zirconium |
| Bio and other materials              | natural cork, natural rubber, natural teak wood, sapele wood, coking coal, hydrogen and helium   |

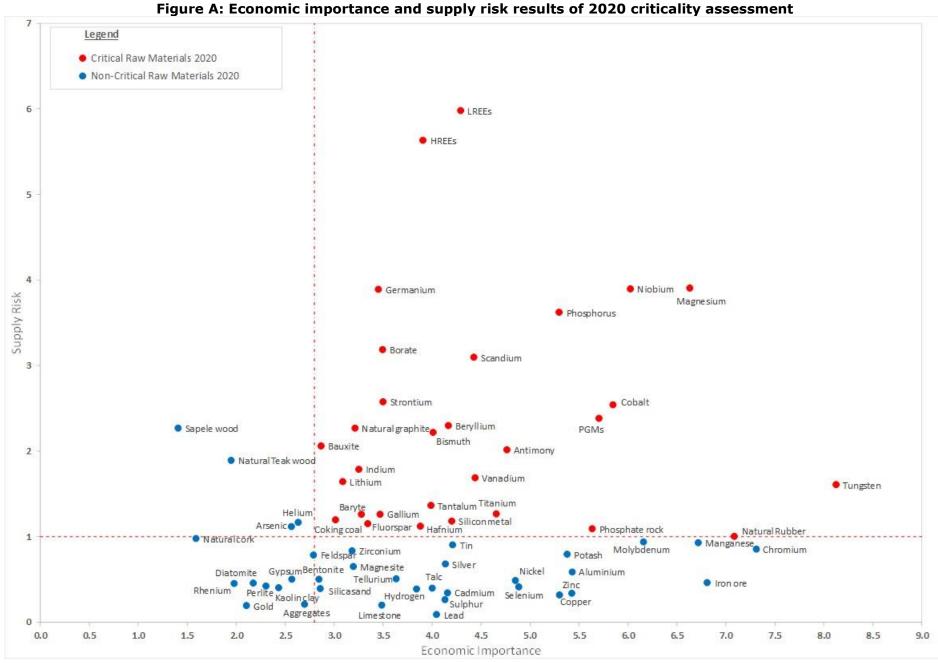

For comparison, 41 candidate materials have been screened in 2011, 54 in 2014 and 61 in 2017.

### Results

Of the 83 individual (66 candidate) raw materials assessed, the following 30 were identified as critical in this assessment:

|             | 2020 Critica | al Raw Materials (30) |               |
|-------------|--------------|-----------------------|---------------|
| Antimony    | Fluorspar    | Magnesium             | Silicon Metal |
| Baryte      | Gallium      | Natural Graphite      | Tantalum      |
| Bauxite     | Germanium    | Natural Rubber        | Titanium      |
| Beryllium   | Hafnium      | Niobium               | Vanadium      |
| Bismuth     | HREEs        | PGMs                  | Tungsten      |
| Borates     | Indium       | Phosphate rock        | Strontium     |
| Cobalt      | Lithium      | Phosphorus            |               |
| Coking Coal | LREEs        | Scandium              |               |

The overall results of the 2020 criticality assessment are presented in Figure A. Critical raw materials (CRMs) are highlighted by red dots and are located within the criticality zone (SR  $\geq$  1 and EI  $\geq$  2.8) of the graph. Blue dots represent the non-critical raw materials.

The 2020 list confirms 26 of the 2017 CRMs. Three CRMs in the 2020 list were not considered as critical in the 2017 list: Bauxite, Lithium and Titanium. Conversely, Helium, critical in the 2017 CRM list, is no longer in 2020. Strontium is the only new candidate material that is in the 2020 list of CRMs.

|             | 2020 CRMs        | vs. 2017 CRMs     |           |
|-------------|------------------|-------------------|-----------|
| Antimony    | Germanium        | PGMs              | Bauxite   |
| Baryte      | Hafnium          | Phosphate rock    | Lithium   |
| Beryllium   | HREEs            | Phosphorus        | Titanium  |
| Bismuth     | LREEs            | Scandium          |           |
| Borate      | Indium           | Silicon metal     |           |
| Cobalt      | Magnesium        | Tantalum          | Strontium |
| Coking Coal | Natural Graphite | Tungsten          |           |
| Fluorspar   | Natural Rubber   | Vanadium          |           |
| Gallium     | Niobium          | <del>Helium</del> |           |

### Legend:

Black: CRMs in 2020 and 2017

Red: CRMs in 2020, non-CRMs in 2017

Green: CRMs assessed in 2020 that were not assessed in 2017

Strike: Non-CRMs in 2020 that were critical in 2017

The table below summarises the key changes in the 2020 CRMs list compared to the 2014 CRMs list. The 2020 assessment confirmed 19 CRMs from the 2014 list, whereas 8 of the non-critical materials in 2014 shifted to being critical in 2020.

|             | 2020 CRI         | Ms vs. 2014 CRMs |            |
|-------------|------------------|------------------|------------|
| Antimony    | Indium           | Baryte           | Bismuth    |
| Beryllium   | Lithium          | Bauxite          | Phosphorus |
| Borate      | Magnesium        | Hafnium          | Strontium  |
| Cobalt      | Natural Graphite | Natural Rubber   |            |
| Coking Coal | Niobium          | Scandium         |            |
| Fluorspar   | PGMs             | Tantalum         |            |
| Gallium     | Phosphate Rock   | Titanium         |            |
| Germanium   | Silicon Metal    | Vanadium         |            |
| HREEs       | Tungsten         |                  |            |
| LREEs       |                  |                  |            |
| Legend      |                  |                  |            |

Black: CRMs in 2020 and 2014

Red: CRMs in 2020 that were not CRMs in 2014

Green: CRMs in 2020 that were not included in the assessment in 2014

The following tables present the major global supplier of the 2020 critical raw materials. Table A presents the results for individual raw materials. Table B presents the averaged figures on global primary supply for the 3 material groups: HREEs, LREEs, and PGMs.

Table A: Major global supplier countries of CRMs - individual materials

Table B: Major global supplier countries of CRMs – grouped materials (average)

| Material  | Stage | Main global supplier | Share |
|---|-------|----------------------|-------|
| HREEs   | Е     | China                | 86%   |
| LREEs   | Е     | China                | 86%   |
| PGMs <sup>7</sup> (iridium, platinum, rhodium, ruthenium) | Р     | South Africa         | 75%   |
| PGMs (palladium)  | Р     | Russian Federation   | 40%   |

Figure B is the world map of the main global producers of the raw materials listed as critical for the EU in 2020.

<sup>&</sup>lt;sup>6</sup> Stage refers to the life-cycle stage of the material that the criticality assessment was carried out on: extraction (E) or processing (P).

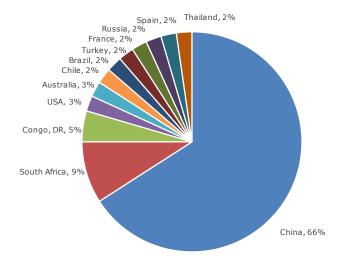

<sup>&</sup>lt;sup>7</sup> Calculating the average for the largest global supplier for all the PGMs is not possible because the major producing country is not the same for each of the five PGMs.

Russia Palladium 40 % France China Antimony Baryte Bismuth USA 38% Spain Beryllium 889 Strontium 31% Coking Coal 55% Turkey Borate 42% 65% 80% Fluorspar Gallium Germanium 80% Indium 48% 89% 69% Magnesium Thailand Natural graphite Natural rubber 33% 48% 74% DRC Phosphate rock Cobalt 59% Phosphorus 66% 66% Scandium Tantalum 33% Silicon metal Brazil Titanium 45% Niobium 92% 69% Tungsten South Africa Australia Vanadium 39% Iridium 92% Bauxite 28% Chile REEs 86% Platinum 71% Lithium 44% HRFFs 86% Rhodium 80% Ruthenium 93%

Figure B: Countries accounting for largest share of global supply of CRMs

An analysis of global supply confirms that China is the largest supplier of several critical raw materials. Other countries are also important global suppliers of specific materials. For instance, Russia and South Africa are the largest global suppliers for platinum group metals, the USA for beryllium and Brazil for niobium.

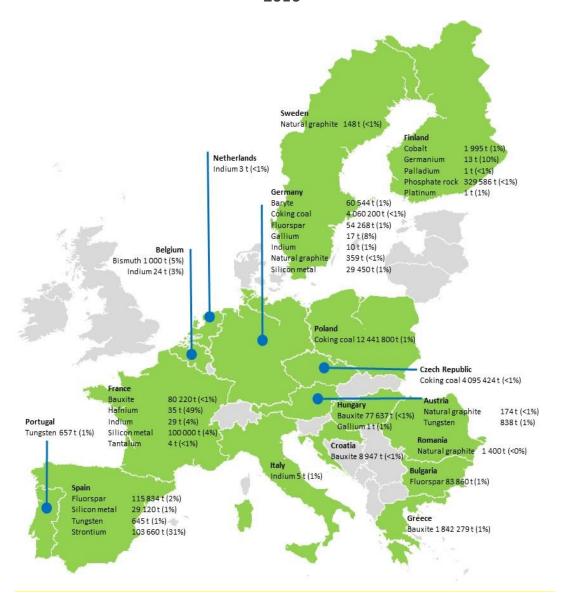

Figure C: Main Global supply countries of CRMs<sup>8</sup> (based on number of CRMs supplied, average 2012-2016)

In terms of the total number of CRMs, China is the major global supplier of 66% of the individual critical raw materials (Figure C). This includes all of the REEs and other critical raw materials such as magnesium, tungsten, antimony, gallium and germanium among others.

<sup>&</sup>lt;sup>8</sup> The figure should not be interpreted in terms of tonnage of CRM that originate from these countries, but in terms of the number of CRMs, for which the country is the main global supplier or producer of the CRM.

Figure D: EU producers of CRMs, in brackets shares of global supply, 2012-20169

<sup>&</sup>lt;sup>9</sup> JRC elaboration on multiple sources

The following tables present the main countries from which the EU is sourcing critical raw materials (EU sourcing). Table C presents the results for individual raw materials. Table D presents the averaged figures for 3 material groups: HREEs, LREEs, and PGMs.

Table C: Major EU sourcing countries of CRMs - individual materials

| PGMs   |             | Iridium, palladium, platinum, rhodium, ruthenium  |                     |       |      |                  |         |                     |          |

Table D: Major EU sourcing countries of CRMs – grouped materials (average)

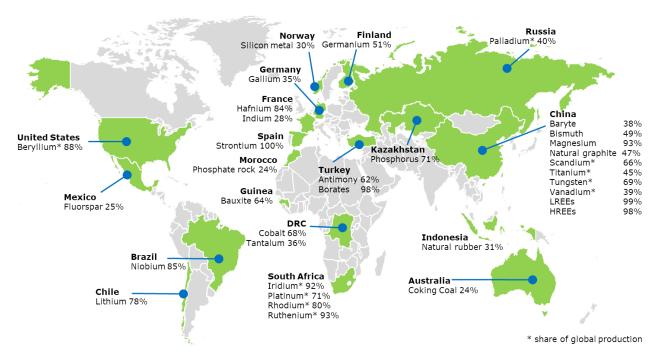

| Material | Stage | Main global supplier | Share |
|----------|-------|----------------------|-------|
| HREEs    | Р     | China                | 98%   |
| LREEs    | Р     | China                | 99%   |
| PGMs     | Р     | n/a                  | n/a   |

Figure E is the world map of the main countries from which the EU is sourcing critical raw materials (EU sourcing).

10

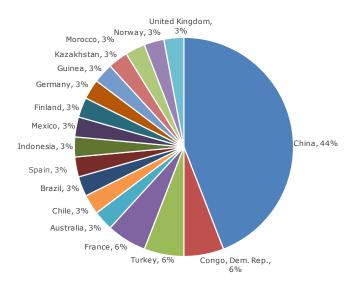

<sup>&</sup>lt;sup>10</sup> Stage refers to the life-cycle stage of the material that the criticality assessment was carried out on: extraction (E) or processing (P).

Figure E: Countries accounting for largest share of EU sourcing of CRMs

Despite China being the largest global supplier for the majority of the critical raw materials, the EU sourcing (i.e. domestic production plus imports) paints sometimes a different picture (Figure E). The picture of EU sourcing lacks specific data for the five PGMs, titanium and beryllium. Although China is certainly a major EU supplier (44% of materials, in number, as shown in Figure F), several other countries represent main shares of the EU supply for specific critical raw materials, such as Brazil (niobium), Chile (lithium) and Mexico (fluorspar).

Figure F: Main EU suppliers of CRMs<sup>11</sup> (based on number of CRMs supplied, average 2012-2016)

All raw materials, even if not considered critical, are important for the EU economy. The fact that a given material is classed as non-critical does not imply that availability and importance to the EU economy can be neglected. Moreover, the availability of new data and possible evolutions in EU and international markets may affect the list in the future.

<sup>&</sup>lt;sup>11</sup> The figure should not be interpreted in terms of tonnage of CRM that originate from the countries, but in terms of the number of CRMs, for which the country is the main supplier for the EU.

### 1. INTRODUCTION

### 1.1. CONTENT AND PURPOSE OF THIS REPORT

This joint GROW and JRC report 'Study on the review of the list of Critical Raw Materials' serves as the background document in support of the 2020 list of CRMs for the EU.

The present report is the result of intense cooperation with the Ad hoc Working Group on Defining Critical Raw Materials (AHWG<sup>12</sup>), consultants and key industry and scientific experts identified through the H2020 SCRREEN<sup>13</sup> project.

This report includes information on the criticality assessments carried out on the materials covered for this 2020 exercise. Further information is presented in the materials factsheets<sup>14</sup>, for both critical and non-critical materials. These factsheets are provided as separate documents and are available in the EC's Raw Materials Information System (RMIS)<sup>15</sup>.

The present report is divided into the following chapters and annexes:

- Chapter 1 Introduction to the report: objectives and context of critical raw materials in Europe;
- Chapter 2 Criticality assessment approach: scope of the criticality assessments, application of the EC criticality methodology, data sources used and stakeholder consultation;
- Chapter 3 Criticality assessment outcome: results and key findings, comparison with previous assessments and limitations of the assessment results, conclusions and recommendations; and
- Annexes Additional supporting information on the methodology, international developments, quantitative assessment and related data, stakeholder consultations

### 1.2. OBJECTIVES OF THIS REPORT

This report presents the results of the assessment of the criticality of 83 raw materials for the EU based on the revised methodology developed by the European Commission (DG GROW and DG JRC) $^{16}$ . The report builds upon the work carried out in the previous assessments ( $2011^{17}$ ,  $2014^{18}$  and  $2017^{19}$ ). The report takes into account feedback gathered from the previous and 2020 exercises, and in doing so, establishes the basis for the updated list of critical raw materials for the EU.

1 individual factsheet for Aluminium (metal and bauxite)

<sup>12</sup> The AHWG on Defining Critical Raw Materials is a sub-group of the Raw Materials Supply Group expert group. The list of its members and observers is available here:

http://ec.europa.eu/transparency/regexpert/index.cfm?do=groupDetail.groupDetail&groupID=1353

<sup>13</sup> http://scrreen.eu/the-project/

The factsheets for critical and non-critical materials are provided as separate documents and are available through the RMIS. A total of 68 factsheets, corresponding to the 83 candidates (including both individual materials and groups) are included. The breakdown of the 68 factsheets are as follows:

<sup>• 64</sup> individual material factsheets

<sup>• 1</sup> individual factsheet for Phosphorus (phosphorus and phosphate rock)

<sup>• 1</sup> grouped factsheet for the REEs (with sections dedicated to single elements)

 <sup>1</sup> grouped factsheet for the PGMs

<sup>15</sup> https://rmis.jrc.ec.europa.eu/

<sup>&</sup>lt;sup>16</sup> Methodology for establishing the EU List of Critical Raw Materials, 2017, ISBN 978-92-79-68051-9

<sup>&</sup>lt;sup>17</sup> 2011 assessment refers to the study on Critical Raw Materials for the EU published in 2010 and the Commission's Communication COM(2011)25 adopted in 2011.

<sup>&</sup>lt;sup>18</sup> 2014 assessment refers to the study on Critical Raw Materials at EU level published in 2013 and the Commission's Communication COM(2014)297 adopted in 2014.

<sup>&</sup>lt;sup>19</sup> 2017 assessment refers to the study on Critical Raw Materials at EU level published in 2016 and the Commission's Communication COM(2017)0490 final adopted in 2017.

The operational objectives of this study were to:

- Assess the criticality of a selection of raw materials based on the EC criticality methodology.
- Analyse the production, key trends, trade flows and barriers of the raw materials with the aim to identify potential bottlenecks<sup>20</sup> and supply risks throughout the value chain. To the extent possible, data and projections are based on the reference period of the last 5 years in terms of data availability.
- Produce qualitative factsheets for all the raw materials assessed.
- Produce full datasets, calculation sheets and comprehensive list of data sources in an excel-compatible format.
- Continue to improve the quality and availability of data.
- Cooperate with both EU and non-EU experts (where relevant) to improve the findings of the study.
- Collaborate with the expert group 'Ad hoc Working Group on Defining Critical Raw Materials'<sup>21</sup> and with the SCRREEN<sup>22</sup> expert group.

In particular, the 2020 assessment incorporates the following aspects:

- Analysis of a wider range of raw materials (5 new candidates);
- Introduces a systematic two-stage supply chain assessment of the supply risk (mining/extracting and processing/refining stages);
- Updated factsheets for each of the materials assessed to include information on the supply chain, the criticality assessment and future trends;
- Optimise data quality and transparency, in respect to the hierarchy of data sources identified in the EC methodology, both in the assessments and factsheets; and
- Better coordination with parallel efforts to develop further Material System Analyses<sup>23</sup>, as the priority data source for e.g. recycling data (EOL-RIR).

### 1.3. THE PURPOSE OF THE LIST OF CRITICAL RAW MATERIALS FOR THE EU

The assessment and the list of critical raw materials are intended to flag the supply risks of important materials for the EU economy. They contribute to securing the competitiveness of the EU industrial value chains starting with raw materials in line with the EU industrial policy. This should increase the overall competitiveness of the EU economy, in line with the Commission's priorities. It should also help incentivise the European production of critical raw materials and facilitate the launching of new mining and recycling activities. The list is also being used to help prioritise needs and actions. For example, it serves as a supporting element when negotiating trade agreements, challenging trade distortion measures or promoting research and innovation actions.

It is also worth emphasising that all raw materials, even if not classed as critical, are important for the European economy and that a given raw material and its availability to the European economy should therefore not be neglected just because it is not classed as critical.

\_

<sup>&</sup>lt;sup>20</sup> A bottleneck is considered to be the point in the value chain for a specific material where the supply risk is highest, i.e. the stage (either extraction/harvesting or processing/refining), that has the highest numerical criticality score for the Supply Risk.

<sup>&</sup>lt;sup>21</sup> The consultants have provided scientific and technical support to the Commission throughout the course of the study, incorporated relevant comments and feedback, provided updates on the advancement of the work, and presented the findings of the assessment in the final report of the study on "Critical Raw Materials for the EU" and the publication of the new list of Critical Raw Materials.

<sup>22</sup> http://scrreen.eu/the-project/

<sup>&</sup>lt;sup>23</sup> As part of a broader project, JRC and GROW are current delevoping or updating the MSA of 14 raw materials

### 1.4. THE IMPORTANCE OF RAW MATERIALS IN EUROPE

In the last decade the growing challenge of securing access to metals and minerals needed for economic production has received increased attention from the public, economic actors and from politicians. Raw materials are not only essential for the production of a broad range of goods and services used in everyday life, but also for the development of emerging innovations, which are notably necessary for more eco-efficient technologies and globally competitive products.

The importance of metals and minerals to sustain businesses and the economy is particularly true for the EU, where about 30 million jobs<sup>24</sup> are directly reliant on access to raw materials.

The importance of critical raw materials for the EU:

- **Industrial value chains** non-energy raw materials are linked to all industries across all supply chain stages.
- **Strategic technologies** technological progress and quality of life rely on access to a growing number of raw materials. For example, a smartphone might contain up to 50 different kinds of metals, all of which contribute to its small size, light weight and functionality.
- **Climate, energy and environment** raw materials are closely linked to clean technologies essential to reach carbon neutrality targets by 2050. They are irreplaceable in solar panels, wind turbines, electric vehicles, and energy efficient lighting.<sup>25</sup>

In Europe, the manufacturing industry (i.e. the production of end products and applications) and the refining industry (metallurgy, etc.) are often regarded as more important than the extractive industry (e.g. mining activities). Moreover, the value chain of raw materials is not fully and homogeneously covered by the European industry, with a pronounced imbalance between the upstream steps (extraction / harvesting) and the downstream steps (manufacturing and use). Nevertheless, the need for primary materials, such as ores and concentrates, and also for processed and refined materials is crucial for the wealth - even the survival - of the European industries and their associated jobs and economy.

Actually, very little extraction of non-energy raw materials occurs within European Member States, with e.g. the majority of ore and concentrates or refined materials or metals being sourced from non-European countries.

The following figure represents the main global producers of all candidate critical raw materials (in terms of number of raw materials, not in terms of tonnage). China clearly dominates, with 59% of the raw materials assessed<sup>26</sup> being mainly extracted in China. South Africa and USA are also the principal producer of the raw materials assessed.

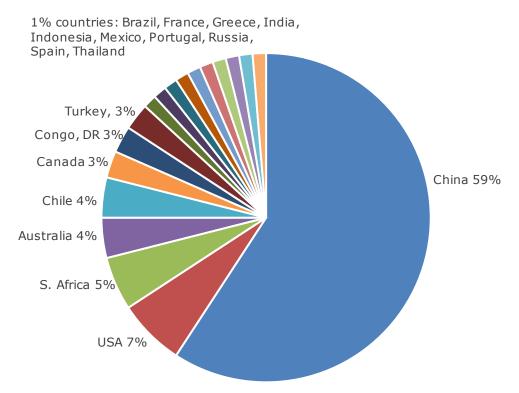

-

<sup>&</sup>lt;sup>24</sup> https://ec.europa.eu/growth/sectors/raw-materials/specific-interest/critical pl

<sup>&</sup>lt;sup>25</sup> https://ec.europa.eu/growth/sectors/raw-materials/specific-interest/critical\_pl

<sup>&</sup>lt;sup>26</sup> Figures are based on the assessment results of individual candidate materials, with the exclusion of sapele wood. Sapele wood was excluded from the analysis of primary global supply because it was not clear from available public EU trade data, which country(s) is the major global supplier. Several producing countries of sapele wood were identified such as Cameroon, Democratic Republic of Congo (Kinshasa), the Republic of Congo (Brazzaville), the Central African Republic, Ivory coast and Gabon, however without a clear indication of the overall shares coming from these producing countries.

Figure 1: Main global suppliers of all candidate critical raw materials assessed, (based on number of raw materials supplied, average from 2012-2016)<sup>27</sup>

Global suppliers of all candidate critical raw materials (% based on number of raw materials supplied)

For many raw materials, the EU is absent from the upstream steps of the value chain, with no extraction of e.g. antimony, beryllium, bismuth, borates, molybdenum, niobium, PGMs, rare earths, tantalum, titanium, vanadium and zirconium. This may be due either to the absence of mineral deposits in the EU, or more often the limited knowledge of the availability of those materials in the EU, or to economic and societal factors that negatively affect exploration (for deposit discovery and characterisation, estimation of resources and reserves) or extraction, (closure of existing mines, reluctance to open new mines, etc.). The biotic materials natural rubber, sapele and natural teak wood come from tropical plants. Their production therefore also lies entirely outside the EU. To access these raw materials, the European Member States have no other choice than to import them, either unprocessed or refined, from other countries to feed their industries and markets.

The only few raw materials for which an EU Member State is the main global producer are hafnium (France), strontium (Spain), natural cork (Portugal) and perlite (Greece). For some raw materials such as e.g. aggregates, feldspar, gypsum, hafnium, indium, kaolin clay, limestone (high purity), magnesite, natural cork, perlite, silica sand, sulphur, the Member States produce enough primary materials to avoid significant extra-European

<sup>&</sup>lt;sup>27</sup> Figures are based on the assessment results of 78 individual materials, rather than 80 due to the exclusion of sapele wood and limestone. Sapele wood was excluded from the analysis of primary global supply because it was not clear from available public EU trade data, which country(s) is the major global supplier. Several producing countries of sapele wood were identified such as Cameroon, Democratic Republic of Congo (Kinshasa), the Republic of Congo (Brazzaville), the Central African Republic, Ivory Coast and Gabon, however without a clear indication of the overall shares coming from these producing countries. Also Aggregates and Hydrogen are excluded because global production is not available.

imports. However, this situation is fairly uncommon, with the EU being dependent on foreign imports for more than 80% of the raw materials needed for its industry and economy.

### 1.5. THE CHALLENGE OF CRITICAL RAW MATERIALS IN EUROPE

The dynamic technological changes and the rapid growth of emerging economies have led to an increasing, though sometimes volatile, demand for several metals and minerals. Securing access to a stable supply of such critical raw materials has become a major challenge for national and regional economies with limited indigenous natural resources, such as the EU economy, which is heavily dependent on imported supplies of many minerals and metals needed by industry.

Many of these materials are currently only extracted in a few countries, with China being the leading supplier as well as consumer of several important raw materials e.g. antimony, bismuth, magnesium, REEs, etc. This increases the risk of supply shortages and supply vulnerability along the value chain.

The likelihood of supply disruption is further increased by the fact that processing, smelting and refining of many metals are also concentrated in a small number of countries. On top of high concentration, some producing countries strictly control and limit the export of raw materials, intermediates and/or metals in order to safeguard them for their national industries, by imposing a number of export restriction measures that are often considered as distortive to free markets.

Supply restrictions can bring negative consequences to all the actors of the supply chain, as they have an influence on the supply conditions and price volatility. Mine production of minerals and metals often relies on large scale investment projects, which can take many years to implement, and, therefore, cannot react quickly to short term changes in demand, or are vulnerable to market manipulations by established suppliers trying to hamper emerging mining operations.

These factors together lead to a risk of supply shortages for various metals and minerals in the EU. The resources known to exist in the EU are not used well to provide adequate and timely supplies of these materials to meet domestic demand. The impact of raw materials supply disruption could therefore be loss of competitive economic activity in the EU and in some specific cases reduced availability of certain (strategic) final products.

### 1.6. ADDRESSING CRITICAL RAW MATERIAL CHALLENGES

### The Raw Materials Initiative and the Identification of Critical Raw Materials

To address the growing concern of securing valuable raw materials for the EU economy, the European Commission launched the European Raw Materials Initiative<sup>28</sup> in 2008. It is an integrated strategy that establishes targeted measures to secure and improve access to raw materials for the EU:

- Fair and sustainable supply of raw materials from international markets;
- Fostering sustainable supply within the EU; and
- Boosting resource efficiency and promoting recycling.

For the successful implementation of EU policies in the field of raw materials, there is a need to know the key raw materials for the European economy, understand their stocks and flows and the market and to identify the supply bottlenecks.

One of the priority actions of the European Raw Materials Initiative was to establish a list of critical non-energy raw materials (CRMs) at EU level.

CRMs combine a high economic importance to the EU with a high risk of supply disruptions. In this context, the European Commission established an Ad Hoc Working

<sup>&</sup>lt;sup>28</sup> https://ec.europa.eu/growth/sectors/raw-materials/policy-strategy\_en

Group on Defining Critical Raw Materials (AHWG) in 2009 as support and advisory group in identifying the non-energy raw materials considered as critical for the EU. The first report of this group, published in 2010, 'Critical raw materials for the EU', among its many valuable conclusions, suggested that the list of critical raw materials should be updated every three years. Accordingly, in its Communication 'Tackling the challenges in commodity markets and on raw materials' (COM(2011)25), the Commission committed to undertake a regular update of the list at least every three years. Regular revisions of the first assessment were carried out and resulted in the 2014 and 2017 list. The 2020 assessment addresses the fourth list of critical raw materials for the EU.

### The methodology to identify CRMs

The identification of critical raw materials for the EU is based on the methodology developed and updated by the European Commission, in cooperation with the Ad hoc Working Group on Defining Critical Raw Materials (AHWG). Based on the methodology used in the assessments carried out in 2011 and 2014, the EC's Directorate-General for Internal Market, Industry, Entrepreneurship and SMEs (DG GROW) established an internal Administrative Arrangement with the EC's DG Joint Research Centre (DG JRC) in 2015 to undertake a study on improving the assessment methodology used to define critical raw materials for the EU. This study resulted in a refined methodology for assessing the criticality of raw materials, which was applied in the 2017 and this 2020 assessment. The revised EC methodology introduced some targeted methodological improvements while keeping maximum possible comparability of the results with the previous assessments. The two main high-level components of criticality were retained:

- **Economic Importance (EI)** calculated based on the importance of a given material in the EU for end-use applications and on the performance of its substitutes in these applications.
- **Supply Risk (SR)** calculated based on factors that measure the risk of disruptions in supply of a given material (e.g. supply concentration, import reliance, governance performance measured by the World Governance Indicators, trade restrictions and agreements, existence and criticality of substitutes)

### 2. CRITICALITY ASSESSMENT APPROACH

### 2.1 SCOPE & MATERIALS COVERED

The scope of this criticality assessment includes assessment of the 83 individual materials listed in Table 1. To facilitate coherence, all materials from previous assessments are included (with the exception of osmium<sup>29</sup>). This allows for the identification of any key materials that may move from the non-critical to critical status or vice versa.

Table 1: List of materials/groupings covered in the 2020 assessment

| Legend:            |   |
|--------------------|---|
| Green boxes =      | Materials covered in 2014 but not in the 2011 assessments |
| Orange boxes =     | Materials covered in 2017 but not in the 2014 assessments |
| Light blue boxes = | New materials covered in the 2020 assessment              |

| Individual materials         |                      |                |
|------------------------------|----------------------|----------------|
| Aggregates                   | Germanium            | Phosphate rock |
| Aluminium                    | Hafnium              | Rhenium        |
| Antimony                     | Helium               | Scandium       |
| Arsenic                      | Hydrogen             | Selenium       |
| Baryte                       | Indium               | Sulphur        |
| Bauxite                      | Iron Ore             | Potash         |
| Bentonite                    | Lead                 | Silica Sand    |
| Beryllium                    | Limestone            | Silicon Metal  |
| Bismuth                      | Gold                 | Silver         |
| Boron (Borates)              | Gypsum               | Strontium      |
| Cadmium                      | Lithium              | Talc           |
| Chromium                     | Magnesite            | Tantalum       |
| Kaolin clay                  | Magnesium            | Tellurium      |
| Cobalt                       | Manganese            | Tin            |
| Coking coal                  | Molybdenum           | Titanium       |
| Copper                       | Natural Graphite     | Tungsten       |
| Diatomite                    | Nickel               | Vanadium       |
| Feldspar                     | Niobium              | Zinc           |
| Fluorspar                    | Perlite              | Zirconium      |
| Gallium                      | Phosphorus           |                |
| Platinum group metals (PGMs) |                      |                |
| Iridium                      | Platinum             | Ruthenium      |
| Palladium                    | Rhodium              |                |
| Rare earth elements (REEs)   |                      |                |
| LREEs                        | HREEs                |                |
| Cerium                       | Dysprosium           | Lutetium       |
| Lanthanum                    | Erbium               | Terbium        |
| Neodymium                    | Europium             | Thulium        |
| Praseodymium                 | Gadolinium Ytterbium |                |
| Samarium                     | Holmium              | Yttrium        |
| Biotic materials             |                      |                |
| Natural Rubber               | Natural cork         |                |
| Sapele wood                  | Natural Teak wood    |                |

\_

<sup>&</sup>lt;sup>29</sup> Osmium was nominally assessed in 2011 and 2014 as part of the PGM group; however it cannot be assessed in its own right because of the lack of data specific to osmium. It was, therefore, excluded from the 2017 and 2020 exercises. Complementary information on osmium is provided in the PGMs factsheet.

In addition to covering the same materials as previous assessments, the candidate materials assessed in the 2020 exercise also include five new materials<sup>30</sup> with the aim of widening the scope of the materials covered.

### 2.1.1 Bottleneck screening vs Double stage (changes 2017 → 2020)

The bottleneck screening in the 2017 exercise generated some discussion with stakeholders on which was the true bottleneck. In some cases (e.g. cobalt) some experts indicated the processing stage as the one with higher supplier concentration, whereas the numerical assessment pointed to the extraction stage as the one with the higher risk. For the 2020 exercise it was decided to systematically include a double-stage supply risk assessment for those materials where two clear stages could be identified and where an initial analysis revealed the likely existence of the necessary data; see Table 2. The bottleneck could then be more readily identified.

Table 2: List of materials covered by a double-stage supply risk assessment

| 2020        | 2020 Raw materials assessed with double stage |              |          |  |  |  |  |
|-------------|---|--------------|----------|--|--|--|--|
| Antimony    | Erbium  | Lithium      | Tin      |  |  |  |  |
| Beryllium   | Europium                                      | Manganese    | Titanium |  |  |  |  |
| Borate      | Fluorspar                                     | Molybdenum   | Tungsten |  |  |  |  |
| Cerium      | Gadolinium                                    | Neodymium    | Vanadium |  |  |  |  |
| Chromium    | Ho, Tm, Lu, Yb                                | Nickel       | Yttrium  |  |  |  |  |
| Cobalt      | Hydrogen                                      | Praseodymium | Zinc     |  |  |  |  |
| Coking Coal | Iron ore                                      | Samarium     |          |  |  |  |  |
| Copper      | Lanthanum                                     | Silver       |          |  |  |  |  |
| Dysprosium  | Lead  | Terbium      |          |  |  |  |  |

In accordance to the EC methodology, the stage with higher Supply Risk (SR) score has been used. For the remaining candidate materials, the assessment of the calculation risk was performed with the same approach and in the same stage in the supply chain as in 2017.

Annex 2 provides further information on the stage assessed and the rationale.

### 2.1.2 Time coverage

The reference period for data used in the assessments is the 5-year average for 2012-2016, where possible. Exceptions to this are clearly stated and justified in the individual factsheets.

\_

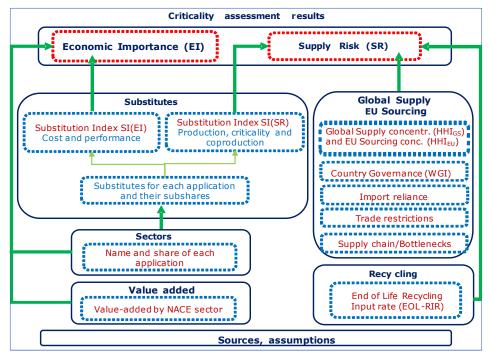

<sup>&</sup>lt;sup>30</sup> Arsenic, Cadmium, Hydrogen, Strontium, Zirconium

### 2.2 THE EC CRITICALITY METHODOLOGY

An overview of the EC's criticality methodology<sup>31</sup> is reported in Figure 2.

Two main parameters form the basis of the updated methodology: Economic Importance (EI) and Supply Risk (SR).

Figure 2: Overall structure of the criticality methodology<sup>32</sup>

The 2020 assessment applies consistently the EC criticality methodology, while ensuring comparability with the previous methodology used in 2011, 2014 and 2017.

There are several updates compared to the 2017 implementation of the revised methodology<sup>33</sup>:

- Identification of the bottlenecks for these two stages: systematic calculation of the supply risk for 36 candidate CRMs for both mining/extracting and processing/refining stages;
- More consistent application of the data source hierarchy in all calculations;
- Substantial improvement of End-of-Life Recycling Input Rate (EOL-RIR) results using higher quality EU based data (14 new Material System Analyses MSA);

### 2.3 DATA COLLECTION AND SOURCES

The availability and quality of the data required to complete the criticality assessment are essential to ensure the robustness and comparability of the results and to maximise the quality of the outputs of the study. A detailed list of the sources used in the criticality assessments are provided in each of the material factsheets.

-

<sup>31</sup> Methodology for establishing the EU List of Critical Raw Materials, 2017, ISBN 978-92-79-68051-9

<sup>&</sup>lt;sup>32</sup> Study on the review of the list of critical raw materials, 2017, ISBN 978-92-79-47937-3

<sup>&</sup>lt;sup>33</sup> Further details in Methodology for establishing the EU List of Critical Raw Materials, 2017, ISBN 978-92-79-68051-9.

The revised criticality methodology includes a data hierarchy that prioritises, first, official EU and Member States data over those from trade/industry associations and other special interest groups. Where possible, it also prioritises the use of data for Europe over datasets that relate to the whole world e.g. global data. In other words, European data shall receive priority over non-EU data. Data from organisations such as the United States Geological Survey (USGS) are used in the cases where no other comparable sources exist or where the alternatives are not of acceptable quality. Data from private sources (industry, trade associations, private data providers etc.) may also be considered in the absence of other data, under the condition that such data can be shared and published.

Regarding the overall availability and quality of the data sources, in general, there is good public data availability for global supply (e.g. from the World Mining Database and British Geological Survey). However, there are some materials that are more difficult to deal with because of material inconsistencies between world production and EU sourcing data. In addition, there is a general difficulty obtaining public data on the shares of applications of materials, as well as their substitutes. Stakeholders were therefore consulted to validate or provide additional inputs regarding the data used for the assessments.

Table 3 presents the scoring matrix used based on the recommendations of the Commission to assess the quality of EU data on EU Supply Risk. The scoring matrix defines three main criteria using a scoring scale of 1 to 3 (from lowest to highest in terms of data quality). The overall score of the data quality used for the calculation of Supply Risk was characterised as: limited, satisfactory or very strong coverage based on the individual scores of the three main criteria. Sources used in the factsheets are provided at the end of each material or group factsheet. Additional details on the quality of the data sources are provided in the individual material factsheets and in the EC's Background Report on the Assessment of the Methodology on the list of Critical Raw Materials<sup>34</sup>.

Table 3: Scoring matrix to evaluate quality of EU supply data

| Criteria Limited coverage |                                     | Satisfactory coverage   | Very strong coverage  |
|---------------------------|-------------------------------------|---|---|
|                           | 1                                   | 2   | 3   |
| Geographic coverage       | Data is not available at EU level   | Data is partly available at EU level                                  | Data is available at EU<br>level                                |
| Time<br>coverage          | Data available only for a few years | Data with no meaningful time series due to poor regularity of updates | Data available for time series and updated at regular intervals |
| Source type               | Private/corporate<br>data           | Public source of data (except from several justified sources)         | Public source   |

### 2.4 STAKEHOLDER CONSULTATION

In addition to the use of data sources described in the previous section, the involvement of stakeholders was of utmost importance in order to maximise the quality of the outputs of the study and to ensure transparency. By involving all relevant industry stakeholders and members of the AHWG, the assessment results reflect the body of knowledge available throughout the EU on the topic of raw materials.

\_

<sup>&</sup>lt;sup>34</sup> JRC technical report (2017): Assessment of the methodology for establishing the EU list of Critical Raw Materials: «Background Report», ISBN 978-92-79-69612-1, available at the JRC Science Hub: https://ec.europa.eu/jrc

The aim of the stakeholder consultation was to ensure that industrial and scientific stakeholders are given the opportunity to provide their expert feedback on specific materials and eventually improve the results. Consultation with stakeholders ensures that the outcomes of this study, especially the conclusions, are optimally validated and subsequently disseminated and applied, where relevant.

In addition to bilateral exchanges during the data collection for the criticality assessment, a key aspect of the overall stakeholder consultation approach includes the stakeholder data collection and validation workshops co-organised with the Horizon 2020 project SCRREEN. These workshops were aimed to collect and review the data used for the purpose of criticality calculations and information used in the factsheets. The stakeholder workshops also provided the opportunity to present the data sources used and contributions delivered by stakeholders as well as to discuss any recommendations to improve results.

The stakeholder data collection and validation workshops took place on 10, 11 and 12 September 2019. The aim of these stakeholder workshops was to discuss in detail the criticality calculations for each of the materials covered and to review and validate the data used in criticality assessments. Experts were also asked to contribute to relevant sections of the factsheets.

Several follow-up actions were carried out after the workshops, which included a summary of key stakeholder feedback received from the validation workshops and follow-up with individual stakeholders who indicated willingness and capability to contribute relevant data and input for the criticality assessments. Based on this feedback, some of the criticality assessments were improved while others were consolidated with more accurate data. A summary report of the stakeholder validation workshops is provided in Annex 8 and includes details of the preparation and organisation of the workshops as well as the list of participants.

### 3. CRITICALITY ASSESSMENT OUTCOME

### 3.1 CRITICALITY ASSESSMENT RESULTS

Table 4 summarises the criticality assessment results for the 83 individual candidate materials covered by the assessment.

Table 4 provides the scaled results of the Supply Risk (SR), Economic Importance (EI), Import Reliance (IR) and End-of-life Recycling Input Rate (EOL-RIR) for each of the candidate materials as well as the life cycle stage assessed. Results are rounded to one decimal point to enhance clarity. The table also indicates the supply data that was used (e.g. global supply and / or EU sourcing) in the calculations for Supply Risk. Annexes provide additional details of the assessment results, including substitution indexes and all other parameters.

Regarding the materials with negative import reliance, i.e. in case of net export, or IR=0, it should be noted that the SR is calculated based on EU sourcing only (except cases with inadequate quality data). Further details on negative import reliance results are provided (see section 3.4.2).

Table 4: Criticality assessment results (individual<sup>35</sup> materials, grouped materials)

### Legend:

| PGMs             | ridium, palladium, platinum, rhodium, ruthenium  |  |  |  |  |
|------------------|--|--|--|--|--|
| LREEs            | Cerium, lanthanum, neodymium, praseodymium and samarium  |  |  |  |  |

| PGMs           | Processing | 2.4            | 5.7 | 98        | 21             | 0.92             | 0.97             | GS only                 |

Figure 3 presents the individual results for the grouped materials. The grey dots in Figure 3 represents the average scores for the platinum group metals (PGMs), the light green dot indicates the average result for the light rare earth metals (LREEs) and the dark green dot presents the heavy rare earth metals (HREEs).

Figure 3: SR and EI for individual materials grouped as PGMs, LREEs and HREEs

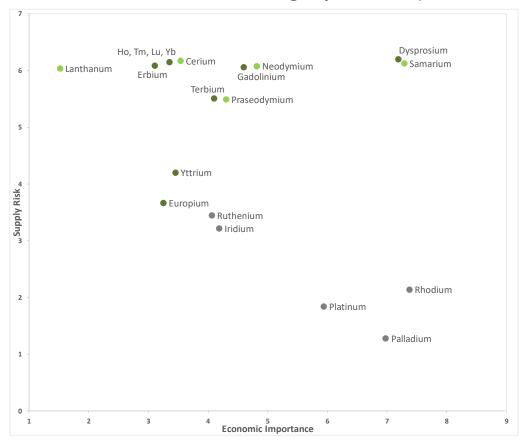

Figure 4 presents the Supply Risk and Economic Importance results for all the individual raw materials. Figure 5 presents the individual results for all non-grouped materials, as well as the average SR and EI scores for the PGMs, LREEs and HREEs groups.

Figure 4: SR and EI results, individual materials and grouped materials

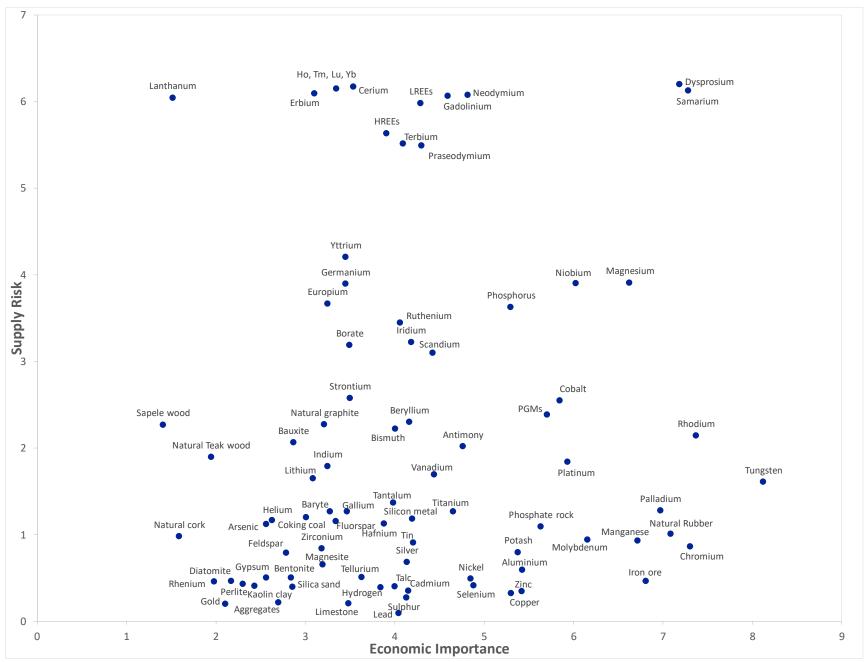

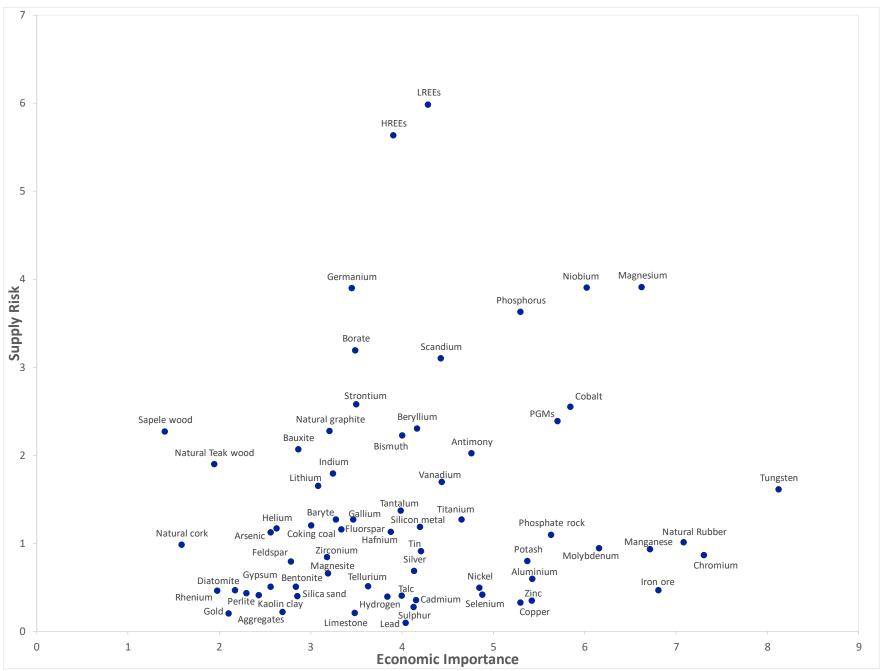

Figure 5: SR and EI results for individual non-grouped and grouped materials (HREEs, LREEs and PGMs)

### 3.2 2020 LIST OF CRITICAL RAW MATERIALS FOR THE EU (CRMs)

Of the 83 candidate raw materials assessed, the following 30 raw materials or groups of raw materials are identified as critical.

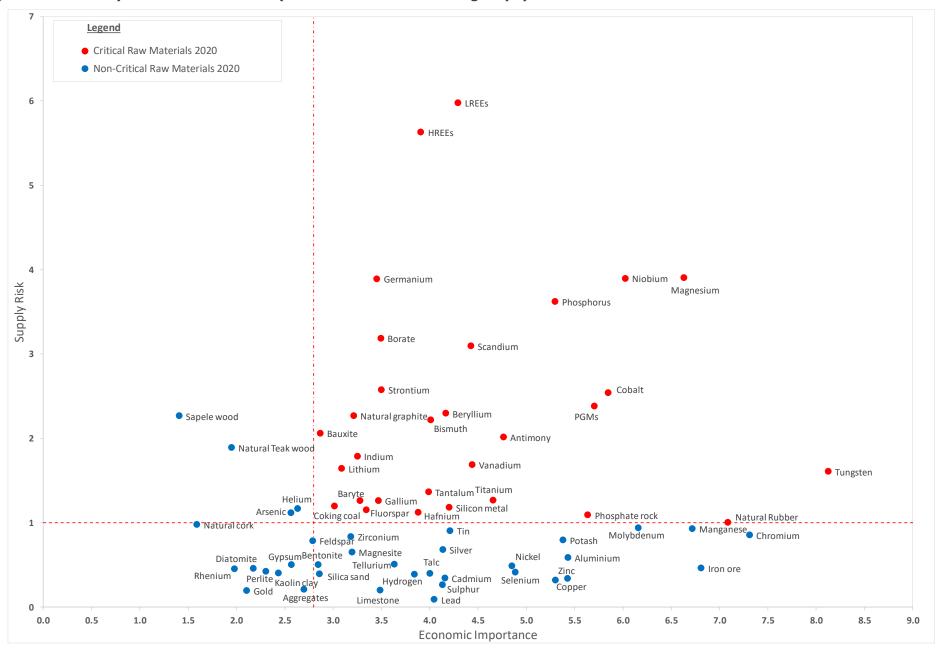

Table 5: 2020 Critical raw materials for the EU

|             | 2020 Critical Raw Materials (30) |                  |               |  |  |  |  |
|-------------|----------------------------------|------------------|---------------|--|--|--|--|
| Antimony    | Fluorspar                        | Magnesium        | Silicon Metal |  |  |  |  |
| Baryte      | Gallium                          | Natural Graphite | Tantalum      |  |  |  |  |
| Bauxite     | Germanium                        | Natural Rubber   | Titanium      |  |  |  |  |
| Beryllium   | Hafnium                          | Niobium          | Tungsten      |  |  |  |  |
| Bismuth     | HREEs                            | PGMs             | Vanadium      |  |  |  |  |
| Borates     | Indium                           | Phosphate rock   | Strontium     |  |  |  |  |
| Cobalt      | Lithium                          | Phosphorus       |               |  |  |  |  |
| Coking Coal | LREEs                            | Scandium         |               |  |  |  |  |

The list of critical raw materials (CRM) is established on the basis of the raw materials which reach or exceed the thresholds for both parameters. There is no ranking order of the raw materials in terms of criticality.

Figure 6 presents the overall results of the criticality assessments mapped against the criticality thresholds. Critical raw materials are highlighted by red dots and are located within the criticality zone (SR  $\geq$  1 and EI  $\geq$  2.8). Blue dots represent the non-critical raw materials.

Figure 6: Criticality assessment results (individual materials and groups)

### 3.3 COMPARISON WITH THE RESULTS OF PREVIOUS ASSESSMENTS

A good level of backwards compatibility and consistency with the previous criticality assessments remains a high priority for the EC. Table 6 highlights the key changes of the 2020 list in comparison to 2017. The changes in SR and EI are illustrated in Figure 7.

The 2020 CRMs list includes 26 of the CRMs identified in 2017. Only one CRM from 2017 shifted out of the list: helium. Compared to the 2017 CRM list, 3 additional raw materials are identified as critical and enter the 2020 CRMs list: bauxite, lithium, titanium. One of the 5 new candidates is in the 2020 list: strontium.

Table 6: Key changes to the 2020 list of CRMs compared to the 2017 CRMs list

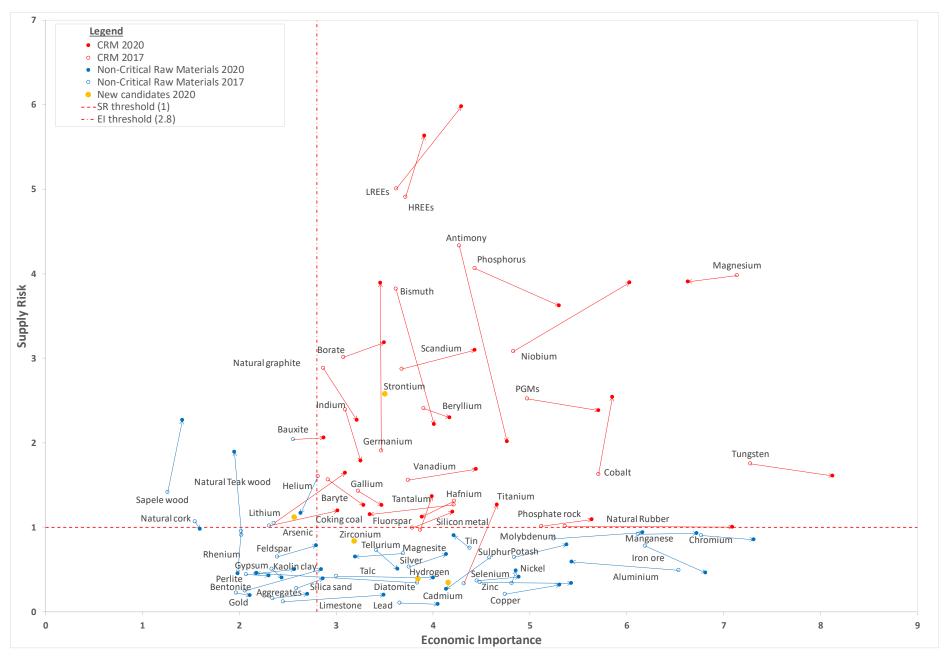

|             | 2020 CRMs vs. 2017 | Legend:           |  |
|-------------|--------------------|-------------------|--|
| Antimony    | LREEs              | Tungsten          |  |
| Baryte      | Indium             | Vanadium          | Black: CRMs in 2020 and 2017                   |
| Beryllium   | Magnesium          |                   | Red: CRMs in 2020, non-CRMs                    |
| Bismuth     | Natural Graphite   | Bauxite           | in 2017  |
| Borate      | Natural Rubber     | Lithium           | Green: CRMs assessed in                        |
| Cobalt      | Niobium            | Titanium          | 2020, not assessed in 2017                     |
| Coking Coal | PGMs               |                   | ,  |
| Fluorspar   | Phosphate rock     | Strontium         | Strike out: Non-CRMs in 2020, critical in 2017 |
| Gallium     | Phosphorus         |                   | Citical III 2017                               |
| Germanium   | Scandium           | <del>Helium</del> |  |
| Hafnium     | Silicon metal      |                   |  |
| HREEs       | Tantalum           |                   |  |

The materials that have remained critical in all assessments are listed in Table 7. Other key differences in the assessments across the exercises are further discussed in the following section.

Table 7: Materials identified as critical in 2011, 2014, 2017 and 2020 assessments

| Critical raw materials in 2011, 201 | 4, 2017 and 2020  |   |
|-------------------------------------|---|---|
| Germanium                           | Natural graphite  |   |
| Heavy rare earth elements           | Niobium   |   |
| Indium                              | PGMs  |   |
| Light rare earth elements           | Tungsten  |   |
|                                     | Germanium<br>Heavy rare earth elements<br>Indium<br>Light rare earth elements | Heavy rare earth elements Niobium Indium PGMs |

Figure 7: 2020 Criticality assessment results compared to the 2017 assessment

### 3.4 KEY FINDINGS OF THE CRITICALITY ASSESSMENTS

This section highlights the key findings of the criticality assessment results, with emphasis on changes since 2017, newly assessed candidate CRMs and battery raw materials. Additional details are provided in the Annexes and in the individual material factsheets.

### 3.4.1 Summary of main results

A general decrease of supply risk and general increase of the economic importance have been observed, though with exceptions. Regarding the economic importance increase, this is mainly due to two reasons: i) there were sectors that grew in comparison with the previous assessment and had a higher value-added; ii) the final result is influenced by a scaling step, as the value-added of the largest manufacturing sector is now lower, corresponding to 27 Member States.

For some of the assessed materials, the criticality assessment highlights changes in the criticality in respect to 2017:

| criticality in respect to 2017. |  |  |  |
|---------------------------------|--|--|--|
| Raw<br>material                 | Changes in SR and EI from 2017 to 2020 | Reason for the change  |  |
| Antimony                        | SR: 4.3 to 2.0                         | In the 2020 assessment the refining stage included also antimony oxides. This resulted in a lower supply risk at the refining stage, since global production was less concentrated and there is also production in the EU. Therefore, in 2020 the mine stage presented higher SR, because the EU has no production; hence is 100% reliant on import.   |  |
|                                 | EI: 4.3 to 4.7                         | Difference is due to changes in the value-added of NACE Rev. 2 sectors.  |  |
| Bauxite                         | SR: 2.0 to 2.1                         | No significant change  |  |
|                                 | EI: 2.6 to 2.9                         | Difference is due to changes in the value-added of NACE Rev. 2 sectors.  |  |
| Coking coal                     | SR: 1.0 to 1.2                         | Different consideration of the available substitutes in 2020. In particular, the use of Pulverized coal for injection (PCI) as a substitute has been removed from the calculation formula, as it is a widely applied technique by the EU steel industry, which has already reached its technical limits. In addition, an error in the calculation formulas of the EU supply risk component resulted in lower supply risk in the previous assessment by a value of 0.1. |  |
|                                 | EI: 2.3 to 3.0                         | Introduction in the 2020 calculation of the NACE 2 sector C20 and a lower share allocated to the C24 sector.   |  |
| Germanium                       | SR:1.9 to 3.9                          | Compared to 2017 in 2020 assessment only global supply of germanium was used in the calculations, since there was a lack of up-to-   |  |

|          |                | date and reliable data for EU sourcing of other<br>Ge products. The global supply of germanium is<br>highly concentrated in China.                                 |
|----------|----------------|--|
|          | EI: no change  | No change  |
| Helium   | SR: 1.6 to 1.2 | Both global supply and EU sourcing became less concentrated.   |
|          | EI: 2.8 to 2.6 | Sectors distribution changed to better represent EU applications.  |
| Titanium | SR: 0.3 to 1.2 | The critical stage in 2020 assessment is the metal stage, which was not studied in 2017 (titanium sponge, essential in high-tech applications).                    |
|          | EI: 4.3 to 4.7 | Changes in the value-added of NACE Rev. 2 sectors.   |
| Tungsten | SR: 1.8 to 1.6 | In 2020 the refining stage was considered to be<br>the most critical. Supply risk was calculated<br>taking into account the distribution of smelters<br>worldwide. |
|          | EI: 7.3 to 8.1 | Changes in the value-added of NACE Rev. 2 sectors.   |

For the main raw materials used in batteries:

| Raw<br>material | Changes in SR and EI from 2017 to 2020 | Reason for the change  |
|-----------------|--|--|
| Cobalt          | SR: 1.6 to 2.5                         | A different approach was applied in the 2020 assessment in order to reflect more accurately the market in the extraction and processing stages. In particular, the trade of intermediate cobalt products requiring further refining was allocated to the extraction stage, whereas in the 2017 assessment they were considered as part of the processing (refining) stage. |
|                 | EI: 5.7 to 5.8                         | No significant changes are observed for the EI.<br>Even with a change in the sectors distribution<br>which better represents the EU applications.  |
| Lithium         | SR: 1.0 to 1.6                         | In 2020 the stage with the higher SR is the processing stage, which was not evaluated in the 2017 exercise.  |
|                 | EI: 2.4 to 3.1                         | Changes in the value-added of NACE Rev. 2 sectors.   |
| Manganese       | SR: 0.9 to 0.9                         | Results are similar to the previous assessment   |

|                     | EI: 6.1 to 6.7 | Results are similar to the previous assessment  |
|---------------------|----------------|---|
| Natural<br>graphite | SR:2.9 to 2.3  | The difference is due to a lower value of the EU supply risk in 2020. The EU sourcing became less concentrated. |
|                     | EI: 2.9 to 3.2 | Changes in the value-added of NACE Rev. 2 sectors.  |

# For the 5 new candidates:

**Table 8: Criticality assessment results for new materials** 

| Material  | Stage<br>assessed | Supply<br>Risk | Economic<br>Importance | Import Reliance<br>(%) | EOL-RIR<br>(%) |
|-----------|-------------------|----------------|------------------------|------------------------|----------------|
| Arsenic   | Р                 | 1.2            | 2.6                    | 32                     | 0              |
| Cadmium   | Р                 | 0.3            | 4.2                    | 0                      | 30             |
| Hydrogen  | Е                 | 0.4            | 3.8                    | 0                      | 0              |
| Strontium | E                 | 2.6            | 3.5                    | 0                      | 0              |
| Zirconium | Е                 | 0.8            | 3.2                    | 100                    | 12             |

| Raw<br>material | Comment  |
|-----------------|--|
| Strontium       | It is the only new candidate classified as critical, due to high supply concentration in Spain (only 1 company).   |
| Arsenic         | The supply risk is based on the global supply risk of arsenic in the form of diarsenic trioxide. Trade figures in Eurostat-Comext were not available in disaggregated form for diarsenic trioxide, thus the calculation for EU supply risk was not possible. |
| Cadmium         | There is a very high recycling rate for cadmium.   |
| Zirconium       | Despite the very high import dependency, global supply and EU sourcing show relatively low concentration.  |
| Hydrogen        | There is a low supply risk as it is mostly produced from diversified sources of natural gas and synthetic gases.   |

## 3.4.2 Summary of other criticality assessment results

## Stages assessed

Table 9 lists the stage with higher SR for each of the critical raw materials The CRMs were assessed at the extraction stage (14) and at the processing stage (16).

Table 9: Stages assessed as critical for the 2020 critical raw materials

| Mining/extraction (14) | Processing/refining (16) |
|------------------------|--------------------------|
| Antimony               | Bismuth                  |
| Baryte                 | Gallium                  |
| Bauxite                | Germanium                |
| Beryllium              | Hafnium                  |
| Borate                 | HREEs                    |
| Cobalt                 | Indium                   |
| Coking Coal            | Lithium                  |
| Fluorspar              | LREEs                    |
| Natural Graphite       | Magnesium                |
| Natural Rubber         | Niobium                  |
| Phosphate Rock         | PGMs                     |
| Tantalum               | Phosphorus               |
| Strontium              | Scandium                 |
| Vanadium               | Silicon Metal            |
|                        | Titanium                 |
|                        | Tungsten                 |

## Analysis of individual materials, Global suppliers and EU sourcing

Table 10 presents the results for the 2020 CRMs as individual materials, i.e. not including the groups HREEs (10 materials), LREEs (5 materials) and PGMs (5 materials).

Table 11 presents the averaged figures on global primary supply for the 3 material groups: HREEs, LREEs, and PGMs. It should be noted, however, that in Table 11 it is not possible to calculate the average for the largest global supplier of all the PGMs because the major producing country is not the same for the five PGMs. For iridium, platinum, rhodium and ruthenium, the major global supplier is South Africa, whereas for palladium the major global supplier is Russia.

Table 10: Global supply of the CRMs, individual materials

<sup>\*</sup>Global supply calculation based on production capacity.

Table 11: Global supply of grouped CRMs, arithmetic average

| Global supply or production capacity of the CRMs – grouped materials (average) |       |                      |       |  |  |
|--|-------|----------------------|-------|--|--|
| Material   | Stage | Main global supplier | Share |  |  |
| HREEs  | E     | China                | 86%   |  |  |
| LREEs  | Е     | China                | 86%   |  |  |
| PGMs <sup>38</sup> (iridium, platinum, rhodium, ruthenium)                     | Р     | South Africa         | 75%   |  |  |
| PGMs (palladium)   | Р     | Russian Federation   | 40%   |  |  |

The analysis of the global supply results indicates that China is the largest global supplier of the critical raw materials. In terms of the total number of CRMs, China is the major supplier (Figure 8<sup>39</sup>). This includes all of the REEs and other critical raw materials including magnesium, tungsten, antimony, gallium and germanium, among others. In addition to China, several other countries are also important global suppliers of specific materials. For instance, Russia and South Africa are the largest global suppliers of platinum group metals, the USA of beryllium and Brazil for niobium.

Furthermore, despite China being the largest global supplier for the majority of the critical raw materials, the analysis of the primary EU sourcing (i.e. domestic production plus imports) paints a different picture (Figure 9<sup>40</sup>). The analysis of the EU sourcing excludes the five PGMs, titanium and beryllium due to little or no EU sourcing activity. Although China is the major EU supplier, several other countries represent main shares of the EU supply for specific critical raw materials, such as the Brazil (niobium), Chile (lithium) and Mexico (fluorspar).

-

<sup>&</sup>lt;sup>38</sup> Calculating the average for the largest global supplier for all the PGMs is not possible because the major producing country is not the same for each of the five PGMs.

<sup>&</sup>lt;sup>39</sup> The figure should not be interpreted in terms of tonnage of CRM that originate from these countries, but in terms of the number of CRMs, for which the country is the main global supplier or producer of the CRM.

<sup>&</sup>lt;sup>40</sup> The figure should not be interpreted in terms of tonnage of CRM that originate from the countries, but in terms of the number of CRMs, for which the country is the main supplier for the EU.

Figure 8: Main global suppliers of CRMs (based on number of CRMs supplied), average from 2012-2016

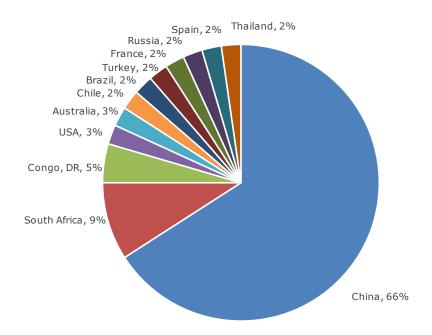

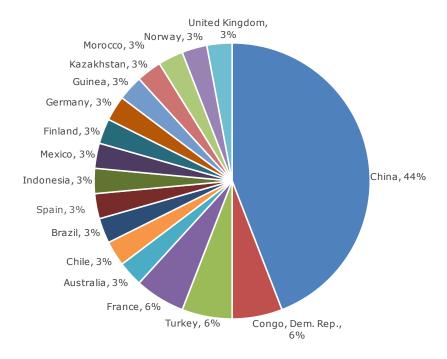

Figure 9: Main EU sourcing countries of CRMs (based on number of CRMs supplied), average from 2012- 2016 (REEs 2016-2018).

Another significant confirmation is that for certain CRMs, despite China being the largest global supplier, other countries represent the main source for the EU; see Table 12.

Table 12: CRMs with China as the largest global supplier but not as largest EU supplier

| CRM            | Main EU supplier | Share of EU sourcing |
|----------------|------------------|----------------------|
| Antimony       | Turkey           | 62%                  |
| Coking coal    | Australia        | 24%                  |
| Fluorspar      | Mexico           | 25%                  |
| Gallium        | Germany          | 35%                  |
| Germanium      | Finland          | 51%                  |
| Indium         | France           | 28%                  |
| Phosphate rock | Morocco          | 24%                  |
| Phosphorus     | Kazakhstan       | 72%                  |
| Silicon metal  | Norway           | 30%                  |

## Analysis of Supply risk results (global SR vs EU sourcing)

The revised methodology made available two measures of the SR, which are certainly useful for a more comprehensive evaluation of the current situation.

In the initial criticality methodology, the SR was estimated based on the mix of global supplier countries only. The revised methodology used an updated Supply Risk formula, which incorporates both global supply and EU sourcing. EU sourcing refers to the actual sources of the supply to the EU Member States.

In the revised methodology, the actual supply to the EU (EU sourcing) is used in combination with the global supply in order to calculate a more representative measure of the risk. The revised methodology uses the Import Reliance (IR) indicator to combine the two measures of Supply Risk, i.e. the one based on global supply and the one based on actual EU sourcing:

Due to concerns over sufficiently available high-quality data, the revised methodology recommends that in the case of data unavailability and/or low quality, the SR should be estimated based on global supply only. This is based on the rationale that although it is not a true measure of the risk specific to the EU, the risk calculated using global supply is probably a more stable calculation and more reliable in terms of data quality. Moreover, the mix of global suppliers is generally more stable in time, whereas the exporters to the EU might change more rapidly.

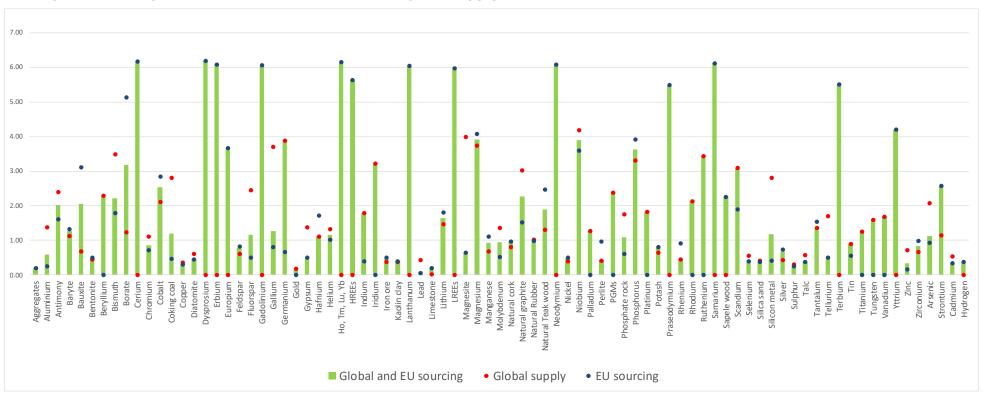

The guidelines for applying the revised SR formula based on both global supply and EU sourcing are summarised as follows:

- Use of both global supply and EU sourcing data, which is the preferred method when the data quality is of sufficient high quality for both indicators;
- Use of global supply data only when the data on EU sourcing is of inadequate quality or not available;
- Use of EU sourcing data only, which is to be used only in specific cases when it is correct to assume that import dependency is negative or at zero percent.

Figure 10 presents a graphical comparison of the difference in SR scores based on the supply data used in the SR calculation. Table 15 in Annex 3 provides the detailed SR figures for each of the materials assessed. Analysis of the different possible SR results indicates that the SR score, when based on global supply only is in general higher compared to EU sourcing data only. It is noted that is not always possible to calculate both global supply and EU sourcing.

The systematic double-stage assessment made available 4 measures of the supply risk, for a limited number of candidate CRMs, as reported in Figure 11.

Figure 10: Comparison of SR results based on scope of supply data used<sup>41</sup>

<sup>&</sup>lt;sup>41</sup> Global supply data and/or EU sourcing supply data i.e. refers to actual sourcing (imports) of the material into the EU

Figure 11: Comparison of SR results based on scope of supply data used (double stage)

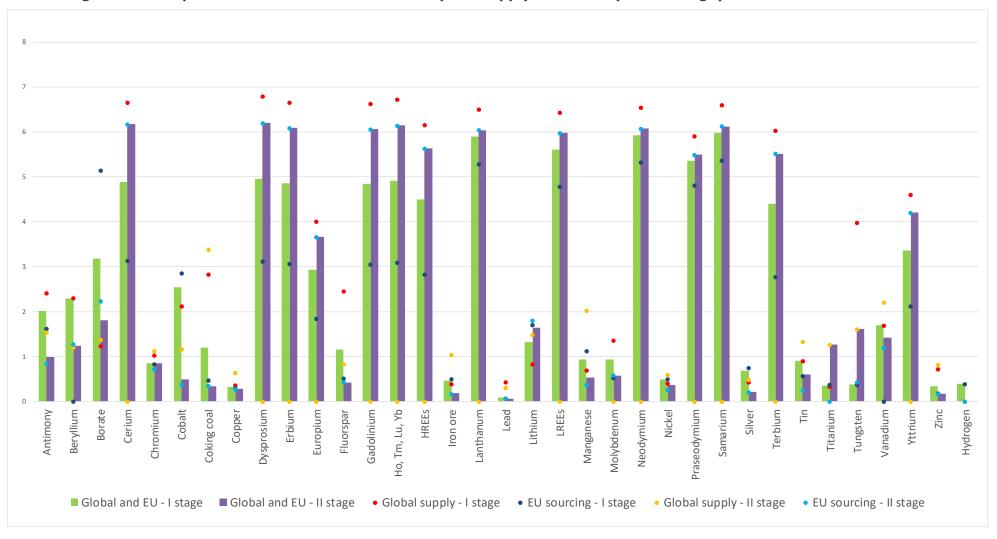

Figure 12: End of life recycling input rate (EOL-RIR)

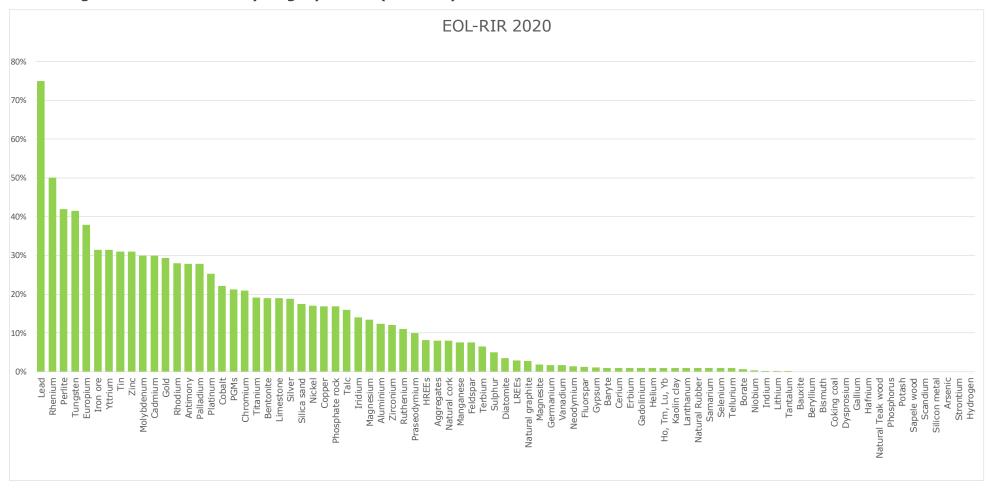

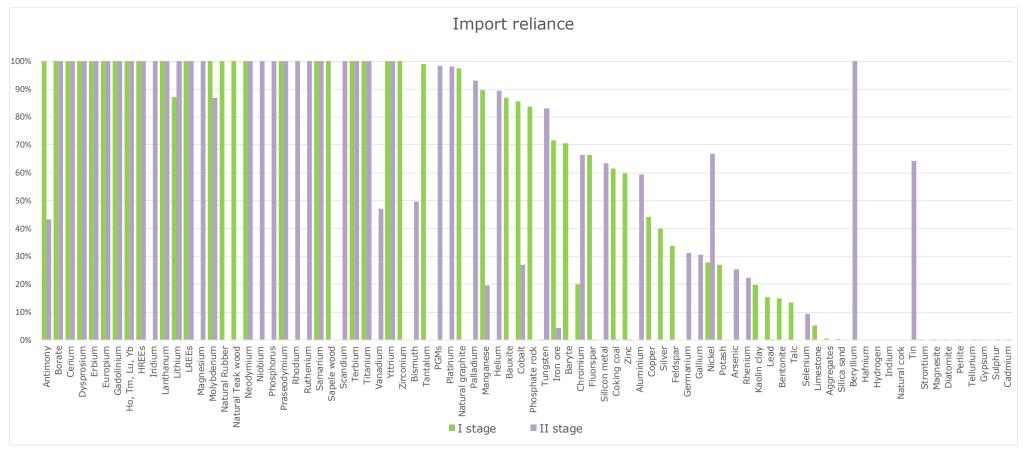

Figure 13: Import reliance

## End-of-Life (EOL)-recycling input rate results

Figure 12 presents the full set of EOL-RIR. EOL-RIR is the selected recycling indicator used as a risk reducing filter in the EC criticality methodology. A remarkable effort was paid to search for or to develop better data for such a key parameter, for which low availability or inadequate quality / representativeness is a well known problem. Synergies were identified and substantial improvements of End-of-Life Recycling Input Rate (EOL-RIR) results, using higher quality EU based data, were made possible thanks to 14 new Material System Analyses (MSAs) that were run in parallel to the criticality assessment.

#### Import reliance results for specific materials

Figure 13 presents the full set of Import Reliance values for all candidate CRMs, in several cases made available at two stages.

For some materials, the import reliance is negative or zero. This means that exports from the EU are higher than imports to the EU (see Table 13). As stipulated in the revised methodology, when IR is 100%, the Supply Risk calculation should take the average of the two indicators, i.e. 50% based on global supply and 50% based on actual EU sourcing. In the few cases where the EU is independent, or almost independent, of imports, the global supply mix is disregarded and the risk is entirely calculated based on the actual sourcing of the material to the EU.

A 0% or <0% IR means that the SR result is calculated based on EU sourcing data only.

**Table 13: Materials with negative or zero Import reliance** 

| Material     | Stage | Actual import reliance |
|--------------|-------|------------------------|
| Material     | Stage | result                 |
| Cadmium      | Р     | -178                   |
| Diatomite    | Е     | -1                     |

| Natural cork | Е     | 0                      |
| Silica sand  | Е     | 0                      |
| Strontium    | Е     | 0                      |
| Sulphur      | Р     | -35                    |
| Tellurium    | Р     | -14                    |
| Tin          | Е     | 0                      |
| Coking coal  | P*    | -3                     |
| Copper       | P*    | 0                      |
| Fluorspar    | P*    | -19                    |
| Lead         | P*    | -1                     |
| Silver       | P*    | 0                      |
| Tungsten     | E*    | -397                   |
| Zinc         | P*    | -2                     |

<sup>\*</sup> Second stage not used to define the criticality

## 3.5 LIMITATIONS OF THE CRITICALITY ASSESSMENTS

Even though it is based on the most robust and comprehensive data available, a criticality assessment remains a screening exercise. This is more a call for attention than an in-depth analysis that would allow for stronger conclusions. Thus, limitations of the criticality assessment are important to take into account when interpreting the results. Key limitations can help to understand the robustness of the 2020 assessment results and the comparability of the results across the four assessments.

# 3.5.1 Robustness of the results

Regarding the robustness of the analysis and corresponding results, despite the use of data of optimal quality, the following **limitations on data** are noted:

- **Data on EU market shares**: For several materials EU market shares were not available, therefore hypotheses and assumptions were used based on available global shares instead. Moreover, there were some issues with the use of NACE 2-digit codes, since a single code had to be selected per application; however, in some cases more than one code was applicable to a specific application.
- Cases with issues on data to assess the EU supply: Similar to the 2017 exercise, also, the 2020 assessment integrates data on EU sourcing (when available and of high quality) to calculate the Supply Risk. Taking into account actual sourcing to the EU provides a more realistic picture of the situation for each material. Previous assessments considered the global supplier mix only to calculate SR. In general, there was good public data availability for global supply for the majority of the materials assessed, however, data on EU sourcing were not always available or were of poor quality for some materials. Further, for some materials, there were also challenges related to inconsistencies in the type of data reported (for the REEs and PGMs for example) e.g. units, % of the material contained, time period covered, life-cycle stage covered, etc. between world production and EU sourcing data. In these cases, only reliable global supply data was used or stakeholders were consulted to validate or provide additional inputs to develop possible justified assumptions and hypothesis, where relevant.
- Data on substitution and shares of material applications: In general, it was difficult to identify or obtain public data on the shares of material applications, as well as their substitutes. The reason for the lack of available and reliable data on the subshare of substitutes for a given application is that there are very few cases where substitutes are actually already being used in practice. As a consequence, in many cases, feedback was sought from industry experts to further develop acceptable assumptions and hypotheses for potential substitutes and sub-shares.
- Data on End-of-life Recycling Input Rates (EOL-RIR): The role of recycling as a risk-reducing filter of Supply Risk remains unchanged compared to the previous EC criticality exercises. Efforts were thus focused on expanding Material System Analysis (MSA) data availability and integrating available high-quality EU based data. Priority remained on EU sources of data such as the MSAs, but also to use data published in the report 'Recycling Rates of Metals' by the International Resource Panel of the United Nations Environment Programme (UNEP) to maintain the highest possible comparability with previous EC criticality reports. In the cases where MSA and UNEP data were not available, data or assumptions were used based on information provided in other sources e.g. sectorial reports, expert judgement and stakeholder inputs. Therefore, the SR result of the materials which use an EOL-RIR figure that does not stem from the preferred reference studies should be considered carefully.
- **Bottleneck screening:** uncertainty related to which stage is more critical has been reduced using a systematic two-stage supply risk assessment as far as possible.

#### 3.6 RECOMMENDATIONS FOR FUTURE ASSESSMENTS

In the Communication on raw materials of  $2011^{42}$ , the EC committed to regularly update the CRM list; every three years. A second and third criticality assessment were therefore published in 2014 and 2017. This study supports the fourth, 2020 list of CRMs for the EU, which is part of the process to maintain and update important information and findings on a regular basis. With this in mind, the following recommendations should be considered in order to facilitate further updates and the robustness of the exercises on criticality in the future.

The recommendations provided address both recommendations for improving the quality of the data used and recommendations for improving the reliability of future exercises.

Regarding recommendations to improve the quality of the data, although the revised methodology advises the use of high-quality EU based data, certain limitations and uncertainties with data sources were identified that could be further improved in future exercises. This underlines the importance of continuing to work closely with industry experts, members of the AHWG, important data providers such as Eurostat and other EC services, as well as Member State authorities to further improve the quality and reporting of European data. The following points could also be considered to increase the quality of the required data:

- Maintaining the importance of the transparency, objectivity and quality of the data used as is recommended in the revised methodology, priority should be given to official and publicly available data over other sources such as private data that cannot be publicly accessed or unofficial / unpublished data. In addition, future exercises should continue to strive to maximise the contributions from all stakeholders and experts to ensure transparency as well as robustness of the data used and results derived. Continuous consultation with industry stakeholders is of crucial importance as they can provide important insights and feedback that are not necessarily available through existing data sources. With this in mind, adequate time should be allowed for the stakeholder consultations and for addressing inputs. This entails not only a period dedicated for the review of the criticality assessment calculations and the material factsheets but also to allow for exchanges with stakeholders and experts regarding contributions and other feedback.
- Working more closely with organisations that publish or provide publicly available EU-based data e.g. Eurostat, OECD, National statistics departments, geological surveys, ministries, trade organisations and others – this is important to further improve the quality and availability of EU production and trade statistics used in the criticality assessments. Regular discussions with these official data providers, for example, would be helpful to identify specific areas e.g. certain Member States, sectors, topics, specific data reporting challenges where greater efforts may be needed to improve and interpret the data reported.
- Finally, it is also essential to maintain the availability of detailed and coherent metadata information from EC public databases as well as the development of explanatory notes related to nomenclatures, which can provide important information in order to accurately interpret the data reported.

In view of future assessments, some recommendations for potential methodological improvements are summarised in Table 14.

\_

<sup>&</sup>lt;sup>42</sup> Communication 'Tackling the challenges in commodity markets and on raw materials' (COM(2011)25)

Table 14: Summary of conclusions and recommendations to further strengthen future criticality exercises

| Topics   | Conclusions and recommendations  |
|--|--|
| Materials and  | <b>Conclusions:</b> Additional efforts can be made to further develop harmonised definitions and to more clearly define the scope of some of the assessments.  |
| scope<br>definitions                                 | <b>Recommendations:</b> Further harmonise nomenclature and terms used to define materials and concepts related to the material life cycles would help in to define the scopes of the assessments. It is important for instance to define a priori the scope of each life cycle stage.  |
| Life-cycle<br>stages<br>accessed                     | <b>Conclusions:</b> A key issue with all criticality assessments is the scope of each assessment made. As with most other analyses of this type, the revised EU methodology focuses on risk related to the first steps in the raw material's life cycle, such as extraction/harvesting, or related to a bottleneck further down the value chain, e.g. influencing potentially the refining steps. These studies generally do not consider the steps in which the refined material is used in a multitude of applications (except in the links in the economic importance). In the 2020 assessment, the first two life cycle stages were more systematic assessed. This reduced the risk of missing the stage with more supply risk in the material's life cycle. But, some raw materials may include an intermediate stage between mining and refining stages that may also be important for the assessment. |
|  | <b>Recommendations:</b> Systematic assessment of both extraction and refining stages should continue in the next assessments.  |
|  | The factsheets should contain a more in-depth investigation of the materials across their life cycle and their supply chains, including for aspects such as future outlook, pricing and other key trends.  |
| End-of-life<br>Recycling<br>Input Rates<br>(EOL-RIR) | Conclusions: While the 2017 revised methodology provides guidelines and data sources than can be used for the EOL-RIR, the available data for all of the materials assessed is of varying quality. Material System Analyses (MSA) serve as a good basis for data gathering for EOL-RIR, however certain elements could be further improved. For example, these studies do not cover all materials in the 2020 criticality assessment and certain data are not reliable and/or up-to-date. In addition, the EOL-RIR used in EC methodology only considers the recycling of primary supply of the raw materials and does not take into account potential Supply Risk associated with secondary raw materials. Imports of "wastes and scraps" are not considered as part of the Supply Risk parameter.  |
|  | <b>Recommendations:</b> Further expansion of MSA studies and updates are needed. The factsheets may provide further information not captured in the EOL-RIR, nor in the CRM assessment, which may include: different recycling indicators reported in the literature and information on imports of wastes and scraps.  |
| Allocation of end-use per sector                     | <b>Conclusions:</b> It was not always straightforward to determine to what extent a specific material is used directly in a manufacturing sector or used in downstream" sectors" towards the final product. An example would be the use of a certain metal in a turbine, which could be a  |

| Topics    | Conclusions and recommendations   |
|-----------|---|
|           | metal product or a piece of machinery. Evidence could also indicate that the material's end-use is in the production and distribution of energy.  |
|           | <b>Recommendations:</b> The selection of applications and associated sectors has a significant influence on the Economic Importance values. Therefore, future methodological improvements could offer additional guidance on the approach to be used. Clear guidance on how to deal with the evolution of volumes and values across the value chain would be helpful. Further modelling of selected key value chains and MSAs would also help, with stronger links being made between such studies and the CRM assessments. |
|           | <b>Conclusions:</b> Official European statistics are prioritised over other sources of data, however on several occasions these databases have gaps that didn't allow proper use of these data sources.   |
| Data Gaps | <b>Recommendations:</b> In future assessments it could be useful to involve e.g. Eurostat directly in these assessments and/or provide feedback from such assessments. This may help to resolve some data gaps and to highlight data needs for the future.  |

# **GLOSSARY**

| Term                                       | Definition in the context of this report  |
|--|---|
| Bottleneck                                 | A bottleneck is considered to be the point in value chain for a specific material where the supply risk is highest, i.e. the stage (either extraction/harvesting or processing/refining), that has the highest numerical criticality score for the Supply Risk.   |
| Critical Raw<br>Materials<br>(CRMs)        | Critical raw materials (CRMs) are raw materials of a high importance to the economy of the EU and whose supply is associated with a high risk. The main two parameters: Economic Importance (EI) and Supply Risk (SR) are used to determine the criticality of the material for the EU. The list of CRMs is established on the basis of the raw materials which reach or exceed the thresholds for both parameters.   |
| Economic<br>Importance<br>(EI)             | One of the two main assessment parameters (in addition to Supply Risk) of the revised EC methodology to measure the criticality of a raw material. In the EC methodology <sup>43</sup> , the Economic Importance is calculated based on the importance of a given material in the EU for end-use applications and on the performance of available substitutes in these applications.  |
| End-of-life<br>Recycling<br>Input Rate     | The end-of-life recycling input rate (EOL-RIR) since the 2017 assessment refers to the ratio of recycling of old scrap in the EU to the EU supply of raw material. In other words, EOL-RIR is production of secondary material from post-consumer functional recycling (old scrap) sent to processing and manufacturing and replacing primary material input. In the previous EC criticality assessments (EC 2011, 2014), recycling rates and EOL-RIR refer only to functional recycling i.e. the portion of EOL recycling in which the material in a discarded product is separated and sorted to obtain recyclates.   |
| Extraction<br>stage                        | Refers to the process of obtaining (extracting) raw materials from our environment and is also referred to as the mining or harvesting stage. This may involve discovering where these raw materials are located (often achieved with knowledge of geology) and developing processes to extract them from these locations (e.g. mining the ores).   |
| Heavy rare<br>earth<br>elements<br>(HREEs) | Heavy rare earth elements (HREEs) are one of the two sub-categories of the rare earth elements (REEs) group. HREEs are part of the lanthanide elements and have higher atomic weights (hence "heavier") compared to the light rare earth elements (LREEs). HREEs are currently used in a few niche applications, which are mostly related to their optical properties (Laser dopants, radiography, etc.). The HREEs (10) covered by the study include dysprosium, erbium, europium, gadolinium, holmium, lutetium, terbium, thulium, ytterbium and yttrium.   |
| Herfindahl-<br>Hirschman-<br>Index (HHI)   | The Herfindahl-Hirschman-Index is a commonly accepted measure of market concentration. In the context of the 2020 exercise, the Herfindahl-Hirschmann-Index (HHI $_{\rm WGI}$ ), based on the world governance index (WGI), is used to calculate the Supply Risk as a parameter quantifying the stability of and level of concentration in producing countries.   |
| Import<br>Reliance (IR)                    | Import reliance (or import dependency) is part of the Supply Risk calculation in the revised EC methodology for updating the list of critical raw materials for the EU <sup>43</sup> . It takes into account actual EU sourcing (net imports divided by a sum of domestic production with net imports) and the level of import dependency in the calculation of Supply Risk.  |
| Light rare<br>earth<br>elements<br>(LREEs) | Light rare earth elements (LREEs) are one of the two sub-categories of the REEs group. LREEs are part of the lanthanide elements and are characterised by lower atomic weights (hence "lighter") compared to HREEs. Generally, LREEs are more abundant in the earth's crust compared to HREEs. LREEs can be used in a wide variety of applications according to the individual REEs and regional specificities, but they are in general used in sectors such as catalysts, metallurgy, glass/polishing and magnets. The LREEs (5) covered by the study include cerium, lanthanum, neodymium, praseodymium and samarium. |
| Mineral<br>deposit<br>New scrap /          | A natural concentration of material of possible economic interest in the earth's crust.  New scrap refers to the scrap generated from processing and manufacturing  |
| Old scrap                                  | processes and it is also sometimes regarded as pre-consumer scrap. It has a   |

 $<sup>^{43}</sup>$  Methodology for establishing the EU List of Critical Raw Materials, 2017, ISBN 978-92-79-68051-9

| Term   | Definition in the context of this report   |
|--|--|
|  | known composition, normally high purity, and origin, and can be often recycled within the processing facility.  Old scrap, also regarded as post-consumer scrap, is the amount of material   |
|  | contained in products that have reached their end of life (EOL). It is often mixed with other materials such as plastics or alloys, therefore its recycling requires further detailed processing for proper recovery.  |
| Platinum<br>group metals<br>(PGMs)                     | Five platinum group metals are covered by the assessment: ruthenium, rhodium, palladium, iridium and platinum. They have similar physical and chemical properties, tend to be found together, and are commonly associated with ores of nickel and copper. The PGMs are generally derived from the same types of ore deposit in which they occur together, commonly in the same mineral phases. For this reason, they are classed as co-products, because they have to be mined together. They rarely occur in native form.  The PGMs are highly resistant to wear, tarnish, chemical attack and high temperature. The PGMs are regarded as precious metals, like gold and silver. All PGMs, commonly alloyed with one another or with other metals, can act as catalysts which are exploited in a wide range of applications. Platinum and palladium are of major commercial significance, with rhodium the next most important. The main use of PGMs is in autocatalysis, but other major applications include jewellery, chemical manufacture, petroleum refining and electrical products. |
| Primary raw<br>material /<br>Secondary raw<br>material | Primary raw materials are virgin materials, natural inorganic or organic substance, such as metallic ores, industrial minerals, construction materials or energy fuels, used for the first time.  Secondary raw materials are defined as materials produced from other sources other than primary. Secondary raw materials can also be obtained from the recycling of raw (i.e. primary) materials. Examples: steel or aluminium scrap.  |
| Processing /<br>refining stage                         | Refers to a series of operations and treatments that transform raw materials from a raw-material state into substances which are then used to make semi-finished and finished products. Also referred to as the post-mining or post-harvesting stage.  |
| PRODCOM /<br>NACE 2                                    | EUROSTAT Prodcom survey provides statistics on the production of manufactured goods. The term comes from the French "PRODuction COMmunautaire" (Community Production) for mining, quarrying and manufacturing: sections B and C of the Statistical Classification of Economy Activity in the European Union (NACE 2). The first four digits refer to the equivalent class within the Statistical classification of NACE, and the next two digits refer to subcategories within the Statistical classification of products by activity (CPA). Most PRODCOM headings correspond to one or more Combined nomenclature (CN) codes related to EU trade.   |
| Rare earth<br>elements<br>(REEs)                       | Refers to a set of 15 elements in the Lanthanide series and two other elements: scandium and yttrium (see definitions for HREEs and LREEs). In the context of this study, yttrium is considered a rare earth element since it tends to occur in the same ore deposits as the lanthanides and exhibits similar chemical properties. However, scandium is not considered as part of the REEs in the study because its properties are not similar enough to classify it as either a heavy rare earth element or light rare earth element. The REEs are typically sub-divided into two groups, the light rare earth elements (LREEs) and heavy rare earth elements (HREEs), both for commercial reasons and their physical-chemical properties. The main uses of REEs are in automotive, telecom and electronics sectors, as well as in the aerospace, defence and renewable energy sectors. REEs find uses in a large variety of applications linked with their magnetic, catalytic and optical properties.   |
| Raw material   | Natural or processed resources which are used as an input to a production operation for subsequent transformation into semi-finished and finished good. Primary raw materials are, as opposed to semi-finished products, extracted directly from the planet and can be traded with no, or very little, further processing.   |
| Reserves   | The term is synonymously used for "mineral reserve", "probable mineral reserve" and "proven mineral reserve". In this case, confidence in the reserve is measured by the geological knowledge and data, while at the same time the extraction would be legally, economically and technically feasible and a licensing permit is certainly available.   |

| Term                | Definition in the context of this report   |
|---------------------|--|
| Resources           | The term is synonymously used for "mineral resource", "inferred mineral resource", "indicated mineral resource" and "measured mineral resource". In this case, confidence in the existence of a resource is indicated by the geological knowledge and preliminary data, while at the same time the extraction would be legally, economically and technically feasible and a licensing permit is probable.  |
| Substitution        | In the revised EC methodology for updating the list of CRMs for the EU, substitution is considered to reduce the potential consequences in the case of a supply disturbance based on the rationale that the availability of substitute materials could mitigate the risk of supply disruptions. It is therefore incorporated in both the Economic Importance (EI) and Supply Risk (SR) dimension as a substitution index. Since the 2017 assessment, only proven substitutes that are readily-available today (snapshot in time) and that would subsequently alter the consequences of a disruption are considered. As a result, only substitution, and not substitutability or potential future substitution is considered in the revised EC methodology. |
| Supply Risk<br>(SR) | One of the two main assessment parameters (along with Economic Importance) of the revised EC methodology to measure the criticality of a raw material. In the EC methodology, the Supply Risk is calculated based on factors that measure the risk of a disruption in supply of a specific material (e.g. global supply and EU sourcing countries mixes, import reliance, supplier countries' governance performance measured by the World Governance Indicator, trade restrictions and agreements, availability and criticality of substitutes).  |
| Value chain         | The value chain describes the full range of activities required to bring a raw material through the different phases of production, transformation, delivery to final consumers and final disposal or recovery after use.  |

#### **ANNEXES**

## Annex 1. Overview of international criticality methodologies and assessments

Criticality is not an absolute concept and the methodologies for the assessment of Critical Raw Materials have to implicitly answer the question "critical to whom?". There is no generic and standardized approach to conduct a criticality assessment. Moreover, criticality is usually considered to be a relative concept in the sense that one material is more or less critical than another.

Criticality assessments are conducted at different levels: for a specific product<sup>44</sup>, technology<sup>45</sup>, company<sup>46</sup>, country or region<sup>47</sup>, or even at a global level<sup>48</sup>. The criticality of a raw material can be considered in the short term (e.g. a few years) or in the long term (a few decades).

Given the different scopes and objectives, a variety of indicators can be used for the assessment. Therefore, comparability is usually not possible between results from different methodologies.

The **International Round Table on Materials Criticality (IRTC)**<sup>49</sup> was partly established to discuss criticality in the context of industry, including the relationship/harmonization of criticality methods. The Round Table consists of international experts, including some criticality method developers, with a focus on relevant stakeholders such as industry representatives.

The **IRTC** published a **review of methodologies**<sup>50</sup> for criticality assessment. A first step of the review was the identification of differences in the goal and scope of the methods, their spatial boundary and time horizons. Secondly, the review analysed the other features of the methodologies: criticality dimensions, factors, indicators, data sources, methodological choices (for instance, use of thresholds, aggregation methods), foreseen application and intended audience.

## Goal and scope of criticality assessment

Concerning the goal and scope phase, methodologies stemmed from different perceptions of "what is at risk". For instance, the first criticality assessments were governmental reports (in the US and UK) referring to raw materials used for national security and defence, and thus considered as "strategic"<sup>51</sup>. Lately, countries with high level of industrialisation and high import dependency for materials started to identify potential supply risk of materials that are important to sustain contemporary lifestyles, and for the development of national and regional economies. Some studies address specific industrial sectors, and identify potential bottlenecks for their deployment. This is the case of low-carbon energy

 50 Schrijvers et al. (2019) A review of methods and data to determine raw material criticality. Resources, Conservation & Recycling.

<sup>&</sup>lt;sup>51</sup> NRC, 2008. Minerals, Critical Minerals, and the U.S. Economy.; Morley, N., Eatherley, D., 2008. Material Security - Ensuring Resource Availability for the UK Economy.

technologies. Geographical scope can be national or regional, but sometimes this is not clearly specified.

**Time horizon** is usually limited to the present status quo, but few studies make future projections<sup>52</sup>.

Three **main objectives** of the criticality studies can be distinguished:

- i) **raise the attention** of decision makers in industry and governments regarding raw materials supply and demand dynamics;
- ii) provide information on **mitigation measures** (diversifying supply, increase recycling, launching new mining projects, etc.)
- iii) perform a **pre-screening** to support prioritization of in-depth analysis.

The **set of materials** under investigation in the criticality studies also varies among different methodologies. Figure 14 provides an overview of the frequency with which materials are included in a selection of criticality assessment studies reviewed in Schrijvers et al. 2019.

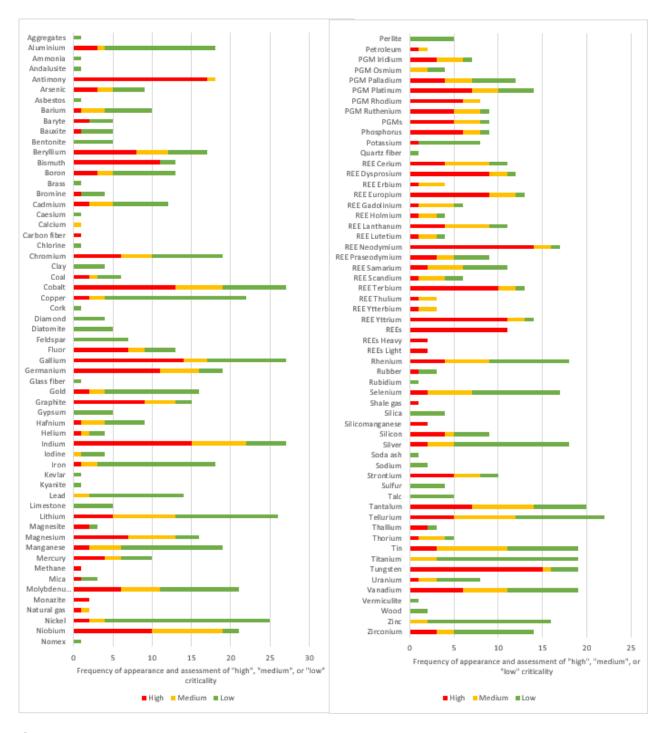

#### Selection of indicators and data sources

Criticality assessments usually combine two main **dimensions** to evaluate materials: supply risk/disruption and vulnerability. These dimensions are characterized through various **indicators**. Diversity of supply, political stability, depletion and recyclability are the most frequently aspects included in the assessment of supply risk. Vulnerability can be assessed with a variety of indicators, which most frequently include substitutability, demand growth and price volatility.

**Data availability** is crucial for any assessment and strongly influences the study outcomes. A wide range of data sources can be used, but geological surveys are the major data providers, together with World Bank, which produces the Worldwide Governance Indicators, that is used by most of the studies. Scientific literature and industry reports are also relevant sources of information, as well as other international organizations report (e.g. UNEP). Data quality can vary from one material to another, as more information is usually available for bulk materials while minor metals, for instance, are more difficult to obtain. Moreover, important data gaps are usually affecting by-products and intermediate products.

The review highlights the importance of a clear **definition of goal and scope** of the study and the understanding of cause-effect mechanisms that link risk factors to indicators. Communication of CRM should also be more transparent regarding the methodological choices and the underlying uncertainty.

<sup>&</sup>lt;sup>52</sup> E.g. KIRAM, KITECH (2014). The current activity of Korea for the rare metals future.; Coulomb et al. (2015). Critical Minerals Today and in 2030: AN ANALYSIS FOR OECD COUNTRIES. OECD Environ. Work. Pap. 0\_1,3-5,8-49.

**Figure 14:** Frequency of appearance in criticality assessments and criticality determination (high, medium, or low) of materials<sup>53</sup> (Schrijvers et al., 2019).

<sup>&</sup>lt;sup>53</sup> Included methods: NRC, Yale (global and country risk, only the supply risk axis), NSTC (2016 and 2018), EU (2011, 2014, and 2017), Helbig (2016 and 2018), Augsburg, KIRAM/KITECH, NEDO, BRGM, Werner, General Electric, iCIRCE, NIES, GeoPolRisk, SCARCE, Oakdene Hollins, Thomason, Rosenau-Tornow, Öko-Institut, Roelich, SDU, China, BGS (2011, 2012, and 2015), OECD, US DOE (both short term and medium term for 2010 and 2011), Moss (2011 and 2013). Excluded methods are BIRD, VDI and UBA (no results), Granta Design, ESSENZ and EBP/Empa (unaggregated results and/or company-specific), Angerer (no materials identified as critical). Multistage analyses and multiple forms of the same material are merged (only bottleneck is included), to avoid double counting of appearances. See SI-B for details on material inclusion and evaluation of methods.

Annex 2. Stages assessed and rationale (only candidate CRMs with single stage screening)

|            | Stage assessed                       |  | Overview of rationales          |                     | Detailed rationales for stage assessed  |   |  |  |
|------------|--------------------------------------|--|---------------------------------|---------------------|---|---|--|--|
| Material   | Extraction                           | Processing                             | Data quality / (un)availability | Known<br>bottleneck | Data quality / (un)availability on EU and global supply   | Known bottleneck / expert feedback  |  |  |
| Aggregates | X                                    |  | X                               |                     | Yes   | Global supply data was available at both stages (extraction and refining). However, there is no strong evidence for significant refining production in the EU, therefore the extraction stage was selected for the criticality assessment.  |  |  |
| Bauxite    | X                                    | See<br>rationale<br>under<br>aluminium | X                               | X                   | Yes   | The criticality of aluminium is assessed for two different life cycle stages, the extraction and processing stage (see Al criticality assessment). Data on global and EU supply was available and used in the assessment. It is important to assess the extraction stage, as the import reliance in Europe is substantial.  |  |  |
| Aluminium  | See<br>rationale<br>under<br>bauxite | X                                      | X                               | X                   | Yes   | The criticality of aluminium is assessed for two different life cycle stages, the extraction and refining (see bauxite criticality assessment). Data on global and EU supply was available and used in the assessment. It is important to assess the refining stage, due to the importance of Aluminium in the European manufacturing sector and the competing demand from other global regions/ countries. |  |  |
| Arsenic    |                                      | X                                      | X                               | X                   | Yes   | Arsenic is a by-product of copper, zinc, etc  |  |  |
| Baryte     | Х                                    |  | Х                               | N/A                 | Global supply data was available at<br>the extraction stage only, therefore<br>this stage was selected for the<br>criticality assessment. | N/A   |  |  |
| Bentonite  | X                                    |  | X                               | X                   | Yes   | Global and EU supply data was available at the extraction stage. Further, there was no robust evidence indicating a bottleneck at the refining stage, therefore the extraction stage was selected. Europe is a major producer of bentonite hence the sector is important for the EU economy.  |  |  |
| Bismuth    |                                      | Х                                      | Х                               | N/A                 | Global supply data was available at<br>the refining stage only, therefore<br>this stage was selected for the<br>criticality assessment.   | N/A   |  |  |
| Cadmium    |                                      | Х                                      | X                               | X                   | Yes   | Cadmium is a by-product of zinc   |  |  |

|           | Stage a    | ssessed    | Overview of rationales          |                     | Detailed rationales for stage assessed  |  |  |  |
|-----------|------------|------------|---------------------------------|---------------------|---|--|--|--|
| Material  | Extraction | Processing | Data quality / (un)availability | Known<br>bottleneck | Data quality / (un)availability on EU and global supply   | Known bottleneck / expert feedback   |  |  |
| Diatomite | X          |            | Х                               | X                   | Global supply data was available at the extraction stage only.  | Global supply data was available at the extraction stage only. Further, there is no strong evidence indicating a bottleneck at the refining stage, therefore the extraction stage was selected for the criticality assessment.   |  |  |
| Feldspar  | X          |            | X                               | X                   | Global supply data was available at the extraction stage only.  | Global supply data was available at the extraction stage only. Further, there is no strong evidence indicating that there is a bottleneck at the refining stage, therefore the extraction stage was selected for the criticality assessment.   |  |  |
| Gallium   |            | X          | X                               | N/A                 | Global supply data was available at<br>the refining stage only, therefore<br>this stage was selected for the<br>criticality assessment.           | N/A  |  |  |
| Germanium |            | X          | N/A                             | X                   | N/A   | Ge is a by-product extracted from Zn ores and there are no Ge ores imports to the EU. Therefore, the processing stage was selected for the criticality assessment as it is assumed the processing stage has the highest supply risk i.e. bottleneck  |  |  |
| Gold      | X          |            | Х                               |                     | Global supply data was available at<br>the extraction stage only, therefore<br>was selected for the criticality<br>assessment.                    | N/A  |  |  |
| Gypsum    | X          |            | X                               | X                   | Global and EU supply data was available at the extraction stage only.   | Global and EU supply data was available at the extraction stage only. The rationale for the selection of the bottleneck is that for most industrial minerals the extraction stage is the bottleneck, as they are produced and sold in this form to product manufacturers.  |  |  |
| Hafnium   | -          | X          | N/A                             | X                   | N/A   | Hafnium is only obtained as a by-product during the processing of other minerals e.g. zirconium. Therefore, data at the extraction (mine) level cannot exist. As such, the processing stage was selected as the bottleneck for the criticality assessment as the data used represents materials obtained after processing. |  |  |
| Helium    |            | X          | X                               | N/A                 | Global supply data was available at<br>the refining stage only, therefore<br>the processing stage was selected<br>for the criticality assessment. | N/A  |  |  |
| Hydrogen  |            |            | Х                               | N/A                 | EU sourcing only  | N/A  |  |  |

|             | Stage assessed |            | Overview of rationales          |                     | Detailed rationales for stage assessed  |   |  |  |
|-------------|----------------|------------|---------------------------------|---------------------|---|---|--|--|
| Material    | Extraction     | Processing | Data quality / (un)availability | Known<br>bottleneck | Data quality / (un)availability on EU and global supply   | Known bottleneck / expert feedback  |  |  |
| Indium      |                | X          | X                               | N/A                 | Global supply data was available at<br>the refining stage only, therefore<br>the processing stage was selected<br>for the criticality assessment. | N/A   |  |  |
| Iridium     |                | х          | N/A                             | X                   | N/A   | Almost all iridium derived from primary source materials (i.e. mine production) is traded in the form of refined metal produced from integrated mining/metallurgical operations. There is only very limited international trade in iridium ores and concentrates, therefore the processing stage was selected for the criticality assessment.   |  |  |
| Kaolin clay | x              |            | X                               | X                   | Global and EU supply data was available at the extraction stage.  | Global supply data was available at the extraction stage only. Further, there is no evidence indicating a bottleneck at the refining stage, therefore the extraction stage was selected for the criticality assessment.   |  |  |
| Limestone   | х              |            | х                               | Х                   | Global supply data for high grade limestone are not readily available.  | Global supply data for high grade limestone are not readily available. Therefore, based on feedback from experts and data availability and quality, the extraction stage was selected for the criticality assessment, nevertheless data availability is very limited to undertake a detailed assessment.  |  |  |
| Magnesite   | х              |            | x                               | N/A                 | Global supply data was available at the extraction stage only, therefore the extraction stage was selected for the criticality assessment.        | N/A   |  |  |
| Magnesium   |                | х          | x                               | X                   | x   | There is no production of dolomite (extraction step of magnesium value chain) or refined magnesium (processing step) in the EU, however the refined materials are significantly imported to the EU, therefore indicating that that the processing step represents the highest supply risk. As such, the processing stage was selected for the criticality assessment. It is important to assess the refining stage of magnesium, due to the importance of magnesium metal in the European manufacturing sector and the competing demand from other global regions/ countries. |  |  |

|                      | Stage assessed |            | Overview of rationales          |                     | Detailed rationales for stage assessed  |  |  |  |
|----------------------|----------------|------------|---------------------------------|---------------------|---|--|--|--|
| Material             | Extraction     | Processing | Data quality / (un)availability | Known<br>bottleneck | Data quality / (un)availability on EU and global supply   | Known bottleneck / expert feedback   |  |  |
| Natural cork         | Х              |            | x                               | X                   | Global supply data was available at the extraction stage only.  | Global supply data was available at the extraction stage only. Further, there is no strong evidence for significant refining production in the EU, therefore the extraction stage was selected for the criticality assessment.   |  |  |
| Natural<br>graphite  | Х              |            | x                               | N/A                 | Global supply data was available at<br>the extraction stage only, therefore<br>the extraction stage was selected<br>for the criticality assessment. | N/A  |  |  |
| Natural<br>Rubber    | x              |            | X                               | X                   | Global supply data was available at the extraction stage only.  | Global supply data was available at the extraction stage only. Further, there is no strong evidence for significant refining production in the EU, therefore the extraction stage was selected for the criticality assessment.   |  |  |
| Natural Teak<br>wood | X              |            | X                               | x                   | Yes   | Global supply data was available at both stages (extraction and refining). However, there is no strong evidence for significant refining production in the EU, therefore the extraction stage was selected for the criticality assessment.   |  |  |
| Niobium              |                | х          | N/A                             | x                   | N/A   | The processing stage was selected for the criticality assessment based on feedback received from experts indicating that the processing stage (e.g. ferroniobium) represents the most important bottleneck for the EU.   |  |  |
| Palladium            |                | x          | N/A                             | Х                   | N/A   | Almost all palladium derived from primary source materials (i.e. mine production) is traded in the form of refined metal produced from integrated mining/metallurgical operations. There is only very limited international trade in palladium ores and concentrates. Therefore, the processing stage was selected for the criticality assessment. |  |  |
| Perlite              | Х              |            | x                               | X                   | Global and EU supply data was available at the extraction stage only.   | Global and EU supply data was available at the extraction st<br>only. Similarly to other industrial minerals, the extraction<br>stages is mainly the bottleneck. Europe is a major producer<br>perlite therefore the extraction stage is of major importance<br>the EU.  |  |  |
| Phosphate<br>rock    | X              |            | X                               | X                   | Global and EU supply data was available at the extraction stage.  | To highlight the difference between an extracted product and a refined product, both phosphate rock and phosphorus (P4) are assessed   |  |  |
| Phosphorus           |                | Х          | Х                               | Х                   | Global and EU supply data was available at the processing stage.  | To highlight the difference between an extracted product and a refined product, both phosphate rock and phosphorus (P4) are assessed   |  |  |

|             | Stage assessed |            | Overview of rationales          |                     | Detailed rationales for stage assessed  |  |  |
|-------------|----------------|------------|---------------------------------|---------------------|---|--|--|
| Material    | Extraction     | Processing | Data quality / (un)availability | Known<br>bottleneck | Data quality / (un)availability on EU and global supply   | Known bottleneck / expert feedback   |  |
| Platinum    |                | x          | N/A                             | х                   | N/A   | Almost all platinum derived from primary source materials (i.e. mine production) is traded in the form of refined metal produced from integrated mining/metallurgical operations. There is only very limited international trade in platinum ores and concentrates. Therefore, the processing stage was selected for the criticality assessment.   |  |
| Potash      | X              |            | X                               | X                   | Global supply data was available at the extraction stage only.  | Global supply data was available at the extraction stage only. Limitations with data availability is the primary reason for the selection of the extraction stage instead of the refining stage to undertake the assessment.   |  |
| Rhenium     |                | X          | X                               | x                   | Global supply data was available at<br>the refining stage only, therefore<br>the processing stage was selected<br>for the criticality assessment. | N/A  |  |
| Rhodium     |                | x          | N/A                             | х                   | N/A   | Almost all rhodium derived from primary source materials (i.e. mine production) is traded in the form of refined metal produced from integrated mining/metallurgical operations. There is only very limited international trade in rhodium ores and concentrates. Therefore, the processing stage was selected for the criticality assessment.     |  |
| Ruthenium   |                | x          | N/A                             | х                   | N/A   | Almost all ruthenium derived from primary source materials (i.e. mine production) is traded in the form of refined metal produced from integrated mining/metallurgical operations. There is only very limited international trade in ruthenium ores and concentrates. Therefore, the processing stage was selected for the criticality assessment. |  |
| Sapele wood | X              |            | X                               | x                   | Yes   | Global supply data was available at both stages (extraction and refining). However, there is no strong evidence for significant refining production in the EU, therefore the extraction stage was selected for the criticality assessment.   |  |
| Scandium    |                | X          | Х                               | N/A                 | Global supply data was available at the refining stage only, therefore the extraction stage was selected for the criticality assessment.          | N/A  |  |
| Selenium    |                | x          | х                               | х                   | Global and EU supply data was available at the processing stage only.   | Global and EU supply data was available at the processing stage only, therefore the processing stage was selected for the criticality assessment. Selenium is a by-product recovered during the refining of copper, therefore it is only the processing stage that is relevant for the assessment.   |  |

|---------------|------------|------------|---------------------------------|---------------------|---|--|--|--|
| Material      | Extraction | Processing | Data quality / (un)availability | Known<br>bottleneck | Data quality / (un)availability on EU and global supply   | Known bottleneck / expert feedback   |  |  |
| Silica sand   | X          |            | X                               | N/A                 | Global supply data was available at<br>the extraction stage only, therefore<br>the extraction stage was selected<br>for the criticality assessment. | N/A  |  |  |
| Silicon metal |            | Х          | ×                               | X                   | Global supply data was available at the refining stage only. Therefore the processing stage was selected for the criticality assessment.            | Global supply data was available at the refining stage only. In addition, expert feedback indicated that there is no significant bottleneck at the extraction stage. Therefore, the processing stage was selected for the criticality assessment based on expert feedback and data availability. |  |  |
| Strontium     | x          |            | X                               | X                   | Yes   | Limited data on metal stage  |  |  |
| Sulphur       |            | Х          | ×                               | X                   | Global supply data was available at the refining stage only.  | Global supply data was available at the refining stage only. Therefore the processing stage was selected for the criticality assessment.   |  |  |
| Talc          | X          |            | X                               | X                   | Global supply data was available at the extraction stage only.  | Global supply data was available at the extraction stage only. Further, there is no strong evidence indicating a bottleneck at the refining stage, therefore the extraction stage was selected for the criticality assessment.   |  |  |
| Tantalum      | X          |            | ×                               | X                   | Global supply data was available at the extraction stage only.  | Global supply data was available at the extraction stage only. Further, there is no strong evidence indicating a bottleneck at the refining stage, therefore the extraction stage was selected for the criticality assessment.   |  |  |
| Tellurium     |            | X          | X                               | X                   | Global and EU supply data was available at the processing stage only.   | Global and EU supply data was available at the processing stage only, therefore the processing stage was selected for the criticality assessment. Tellurium is mainly produced as a byproduct of copper refining, therefore the processing stage is only relevant for this assessment.           |  |  |
| Zirconium     | X          |            | Х                               | Х                   | Yes   | Limited data on metal stage  |  |  |

# Annex 3. Additional details on the criticality assessment results

The following additional criticality assessment results are provided:

- Comparison of Supply Risk results using different supply data (Table 15)
- Comparison of the results of previous assessments (Table 16)
- Individual and average EI and SR results of the grouped materials HREEs, LREEs and PGMs (Table 17)

Table 15 presents the results of the Supply Risk calculation when using different Supply Risk data, which is based either on global supply or EU sourcing data only, or based on both global supply and EU sourcing depending on the availability and quality of the data for a given material, according to 2 stages when available.

## Legend

| PGMs  | Iridium, palladium, platinum, rhodium, ruthenium  |  |  |  |  |  |  |  |
|-------|---|--|--|--|--|--|--|--|
| LREEs | Cerium, lanthanum, neodymium, praseodymium and samarium   |  |  |  |  |  |  |  |
| HREEs | Dysprosium, erbium, europium, gadolinium, holmium, lutetium, terbium, thulium, ytterbium, yttrium |  |  |  |  |  |  |  |

Table 15: Comparison of SR results based on scope of supply data used

Table 16 compares the results of the 2017 and previous assessments<sup>54</sup>.

<sup>&</sup>lt;sup>54</sup> The 2011 assessment used the following material groups: PGMs - palladium, platinum, iridium, rhodium, ruthenium and osmium. - REEs - yttrium, scandium, lanthanum, cerium, praseodymium, neodymium, promethium, samarium, europium, gadolinium, terbium, dysprosium, holmium, erbium, thulium, ytterbium and lutetium. Heavy Rare Earth Elements, Light Rare Earth Elements and Scandium were considered together as Rare Earth Elements.

| <u>Legend</u> |   |  |  |  |  |  |

The average and individual EI and SR scores for each of the individual materials categorised in groups are presented in Table 17 to provide additional information to consider when analysing the results. The SR and EI averages for the PGMs, HREEs and LREEs groups should be considered very carefully because they were not assessed separately in early assessments. PGMs and REEs were treated as single groups in 2011 assessment, and accordingly PGMs, HREEs and LREEs were treated as single groups in 2014. The average results of the five materials that are part of the PGMs group, 10 materials of HREEs group and 5 materials of LREEs group, are presented to allow backwards comparability.

Table 17: Individual and average EI and SR scores for material groups - LREEs, HREEs and PGMs

| Materials         | Supply Risk | Economic<br>Importance | Import<br>reliance (%) | EOL-RIR<br>(%) | Supply data in SR  |
|-------------------|-------------|------------------------|------------------------|----------------|--------------------|
| Cerium            | 6.2         | 3.5                    | 100                    | 1              |                    |

## Annex 8. Worked example of assessment calculation

For the purpose of illustration, step-by-step criticality assessment calculations for Cobalt are shown here. Emphasis is given on the double stage assessment.

## **Economic importance (EI)**

Raw material end-use applications are assigned to the EU's manufacturing sectors at NACE Rev.2 (2 digit level). The weighted sum of application share of by manufacturing sector and Gross Value-Added (GVA) is calculated:

Table 18: Weighted sum of application share by manufacturing sector and GVA

| Application  | Share   | 2-digit NACE sector  | NACE sector<br>GVA (M€) | Contribution to EI<br>(Share x sector<br>GVA) |

<sup>\*</sup>Selecting the correspondence between applications and NACE 2 sectors is done by JRC and validated during stakeholders consultation

The sum of "contribution to EI" is ponderated using the Substitute Index for Economic Importance – SI(EI)<sup>55</sup> linked to substitute cost and technical performance:

$$SI(EI)_{Cobalt} = 0.92$$

**EI** (unscaled)
$$cobalt = 124,606 \times 0.92 = 114,733$$

The result is scaled by dividing the calculated EI score by the highest value of the manufacturing sector NACE Rev.2 at the 2-digit level and multiplied by 10, in order to obtain the value in the scale between 0-10:

**EI** (scaled)
$$_{cobalt} = 114,733 / 196,055 \times 10 = 5.85$$

## Supply risk (SR)

Production data for cobalt, both extraction and processing stage, are given below. To move from fractional shares to a supply risk score, which is based on the Herfindahl-Hirschmann-Index (HHI), the square of the shares is needed. In the calculation of supply risk, the square of the shares are first multiplied by the scaled World governance Index (WGI), leading to a "contribution to  $HHI_{WGI}$ ". This calculation is performed for both the global supply (GS) and the EU supply (EU) and for the two stages, separately.

A trade variable (t), representing export taxes, export quotas and export prohibitions is used to adjust the  $HHI_{WGI-t}$ 

Table 19: Stage I (ores and intermediates). Concentration risk for global supply: Global Supply Risk –  $(HHI_{WGI-t})_{GS}$

<sup>\*</sup>based on OECD database of export restrictions and European Commission database on trade agreements

The following formula is used to calculate SR:

$$SR = \left[ \left( HHI_{WGI,t} \right)_{GS} \cdot \frac{IR}{2} + \left( HHI_{WGI,t} \right)_{EU} \cdot \left( 1 - \frac{IR}{2} \right) \right] \cdot (1 - EoL_{RIR}) \cdot SI_{SR}$$

**Import reliance (IR)** is based on EU import, export (Eurostat Comext) and domestic production (WMD, USGS, Cobalt Market Review) and for cobalt is:

$$IR_{I \text{ stage}} = 86\%$$
  
 $IR_{II \text{ stage}} = 27\%$ 

The weighted sum of HHI for GS and EU is then ponderated using the **Substitute Index for Supply Risk – SI(SR)** and the **End-of-life Recycling Input Rate (EoL-RIR)**<sup>56</sup>:

$$SI(SR)_{Cobalt} = 0.92$$
  
 $EoL-RIR_{Cobalt} = 22\%$ 

SR results for the first and second stages of cobalt:

$$SR_{Cobalt, ores \ and \ intermediates} = \left[2.95 \cdot \frac{0.86}{2} + 3.97 \cdot \left(1 - \frac{0.86}{2}\right)\right] \cdot (1 - 0.22) \cdot 0.92 = \textbf{2.5}$$

$$SR_{Cobalt, metal} = \left[1.61 \cdot \frac{0.27}{2} + 0.54 \cdot \left(1 - \frac{0.27}{2}\right)\right] \cdot (1 - 0.22) \cdot 0.92 = \mathbf{0.5}$$

The thresholds for the criticality assessment are set at 2.8 for economic importance and 1 for supply risk. Therefore cobalt is assessed as critical for the first stage due to both economic importance and supply risk exceed the thresholds, while the second stage results as no critical. If at least one stage exceed the two thresholds, the candidate raw material is assessed as critical.

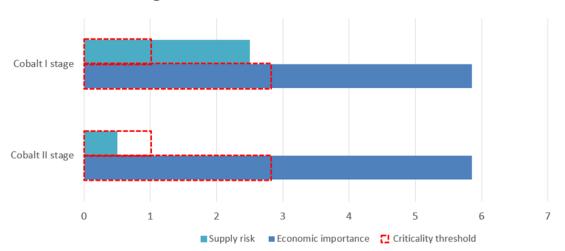

Table 23: EI and SR results for cobalt

| I stage (ores and intermediates) | II stage (metal) |
|----------------------------------|------------------|
| EI = 5.9                         | EI = 5.9         |
| SR = 2.5                         | SR = 0.5         |

## Annex 9. Summary report of the stakeholder validation workshops

## Workshop preparation

In addition to bilateral exchanges during the data collection for the criticality assessment, a key aspect of the overall stakeholder consultation approach includes also the stakeholder data collection and validation workshops co-organised with the H2020 project SCRREEN. These meetings were aimed to review the data used for the purpose of criticality calculations and information used in the factsheets. The stakeholder workshops also provided the opportunity to present the data sources used and contributions delivered by stakeholders as well as discuss any recommendations to improve results.

Three stakeholder data collection and validation workshops took place on 10, 11 and 12 September 2019 at the Hotel Thon in Brussels. The aim of these stakeholder workshops was not to discuss the revised criticality methodology, which had been validated by the AHWG and the Commission, but to discuss in detail the criticality calculations for each of the materials covered during each workshop and to review and validate the data used in criticality assessments. Experts were also asked to contribute to relevant sections of the factsheets.

A balance between the involvement of relevant stakeholders and methodological rigour is essential. For example, in order to maintain objective and transparent results, the workshops should not allow for extensive participation, or even decision making of particular stakeholders regarding the project itself. On the other hand, the affirmation of a majority of stakeholder groups is essential to ensure that the results of the criticality assessments in particular, and the study as a whole, have the desired impact on EU business and policy making

Prior to the workshops, several background documents have been submitted to participants by the consultants. This was to allow the opportunity for participants to familiarise themselves with the study and methodology used, as well as come prepared with any questions discussed during the introduction plenary session of the workshop.

The background documents sent to confirmed participants include:

#### **Detailed agenda** of the workshop(s):

- Details on the conference centre location and key contact information
- Rules of the day specifying the main aims of the workshop in terms of what is expected from participants
- Timetable and agenda of the day, including when the parallel discussions will take place for each material
- List of expected participants (both present and through teleconference)

**Protected detailed calculation files**: sent to the relevant stakeholder participants based on the materials attribution list described above.

**A 1-page summary** summarising the content of the excel calculation files.

### **Draft factsheets**

**Non-disclosure agreement** (NDA): the NDA on information discussed during the workshops and related background documents was sent to all stakeholders who indicated their participation through teleconference. These participants were informed that their participation is dependent on timely reception of a signed NDA e.g. before the workshop. NDAs were distributed for signature at the start of each workshop for participants who are physically present.

## Final workshop organisation

Table 24 provides details on the materials that were covered during the stakeholder validation workshops that were held on 11-12-13September 2019.

# Follow-up of the validation workshops

Several follow-up actions were carried out after the SCRREEN workshops:

- A summary of key discussion points raised by workshop attendees related to the overall work carried out on the criticality assessments.
- Follow-up with individual stakeholders who indicated willingness and capability to contribute relevant data and input for specific criticality assessments. Participants were reminded during the introduction session and throughout the day of the workshop that any of the data provided should be publishable and able to be sourced and cited. In other words, any (confidential) data provided that cannot be sourced or published could not have been accepted.
- E-mails were sent out to all participants thanking them for their interest, time and contributions as well as indicating any relevant follow-up actions e.g. deadlines for input, clarifications on specific input provided, etc.

The list of SCRREEN experts is displayed in Table 25.

# Annex 10. Key authors and contributors

## JRC core team:

Gian Andrea Blengini
Cynthia EL Latunussa
Umberto Eynard
Cristina Torres de Matos
Dominic Wittmer
Konstantinos Georgitzikis
Claudiu Pavel
Samuel Carrara
Lucia Mancini
Manuela Unguru
Fabrice Mathieux
David Pennington

## **Other JRC contributors:**

Jaco Huisman Silvia Bobba Darina Blagoeva

# **External support:**

Michele Dondi (CNR-ISTEC) George Barakos (TU Freiberg) Marie-Theres Krueger (UniLeoben) Maïté Le Gleuher (BRGM) Kostas Komnitsas (TU Crete) Elmer Rietveld (TNO)

## **Contributions from MSA Studies**

Cristina Torres de Matos (co-ordination)
Maren Lundhaug (NTNU)
Daniel Muller (NTNU)
Maria Fernanda (Godoy Leon Univ Ghent)
Jo Dewulf (Univ Ghent)
Luca Ciacci (Univ Bologna)
Andreas Auberger (IFEU)
MonikaDittrich (IFEU)
Mariane Planchon (Deloitte)
Chloé Devauze (Deloitte)

## **GETTING IN TOUCH WITH THE EU**

### In person

All over the European Union there are hundreds of Europe Direct information centres. You can find the address of the centre nearest you at: <a href="http://europa.eu/contact">http://europa.eu/contact</a>

# On the phone or by email

Europe Direct is a service that answers your questions about the European Union. You can contact this service:

- by freephone: 00 800 6 7 8 9 10 11 (certain operators may charge for these calls),
- at the following standard number: +32 22999696 or
- by email via: <a href="http://europa.eu/contact">http://europa.eu/contact</a>

# Finding information about the EU

#### Online

Information about the European Union in all the official languages of the EU is available on the Europa website at: <a href="http://europa.eu">http://europa.eu</a>

# **EU** publications

You can download or order free and priced EU publications from EU Bookshop at: <a href="http://publications.europa.eu/eubookshop">http://publications.europa.eu/eubookshop</a>. Multiple copies of free publications may be obtained by contacting Europe Direct or your local information centre (see <a href="http://europa.eu/contact">http://europa.eu/contact</a>).

#### EU law and related documents

For access to legal information from the EU, including all EU law since 1951 in all the official language versions, go to EUR-Lex at: <a href="http://eur-lex.europa.eu">http://eur-lex.europa.eu</a>

## Open data from the EU

The EU Open Data Portal (<a href="http://data.europa.eu/euodp">http://data.europa.eu/euodp</a> ) provides access to datasets from the EU. Data can be downloaded and reused for free, both for commercial and non-commercial purposes.
