## Mass Flow Meter for Gases

### > Introduction

Bronkhorst® model F-110C Mass Flow Meters (MFM) are suited for precise measurement of virtually all conventional process gases. The MFM consists of a thermal mass flow sensor and a microprocessor based pc-board with signal and fieldbus conversion and a PID controller for optional mass flow control by means of a separately mounted control valve. The mass flow, expressed in normal milliliters per minute or per hour, is provided as analog signal or digitally via RS232 or fieldbus. The flow range and wetted materials are determined depending of the type of gas and the process conditions of the application.

Although all specifications in this datasheet are believed to be accurate, the right is reserved to make changes without notice or obligation.

Intermediate ranges are available

## > Model number identification

## > Thermal mass flow measuring principle

The heart of the thermal mass flow meter/controller is a sensor that consists of a stainless steel capillary tube with resistance thermometer elements. A part of the flow is diverted through this bypass style sensor, and is warmed up by heating elements.

## > State of the art digital design

Today's EL-FLOW<sup>®</sup> series are equipped with a digital pc-board, offering high accuracy, excellent temperature stability and fast response. The basic digital pc-board contains all of the general functions needed for measurement and control. In addition to the standard RS232 output the instruments also offer analog I/O. Furthermore, an integrated interface board provides DeviceNet<sup>™</sup>, PROFIBUS DP, PROFINET, Modbus RTU/ASCII or FLOW-BUS protocols.
