2d $R = C_{11}H_{23}$, $R' = n-C_7H_{15}$
 C_6D_6 , 295 K

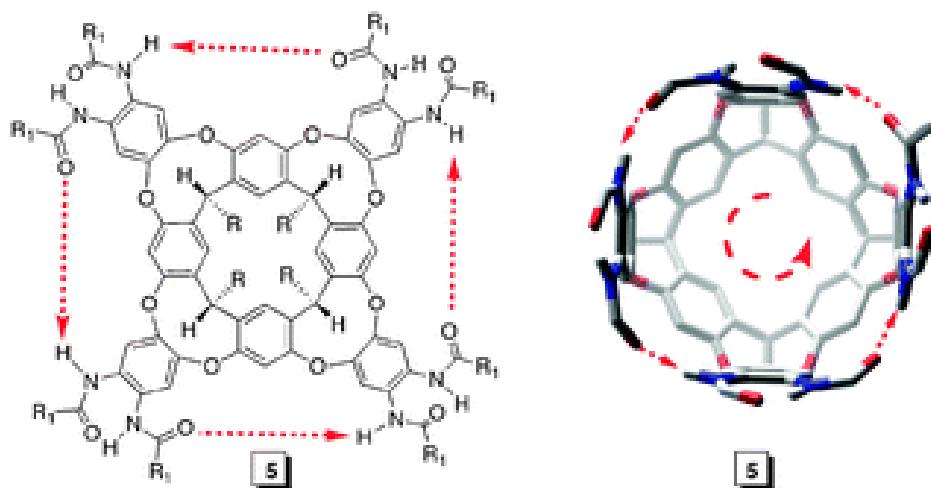

3 $R_1 = C_{11}H_{23}$, $R_2 = C_6H_{13}$

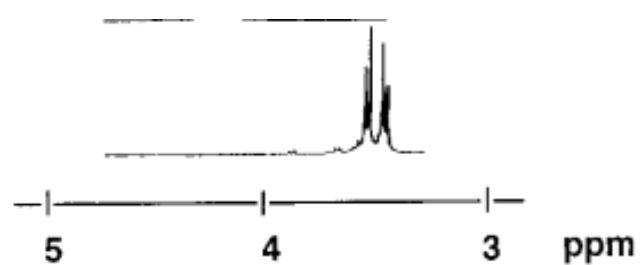

cavitand, four hydrogen bonds need to be broken: those that hold together adjacent rings. The typical costs of such ruptures in organic solvents are roughly 1 to 2 kcal mol⁻¹ per hydrogen bond,¹⁷ so the additional 5 to 7 kcal mol⁻¹ is quite reasonable for the overall 17 kcal mol⁻¹ activation barrier to racemization.

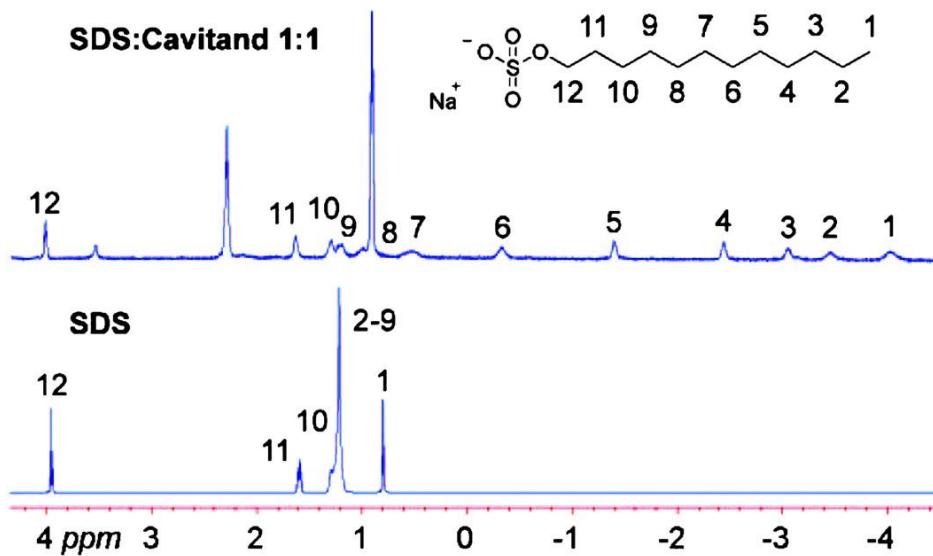

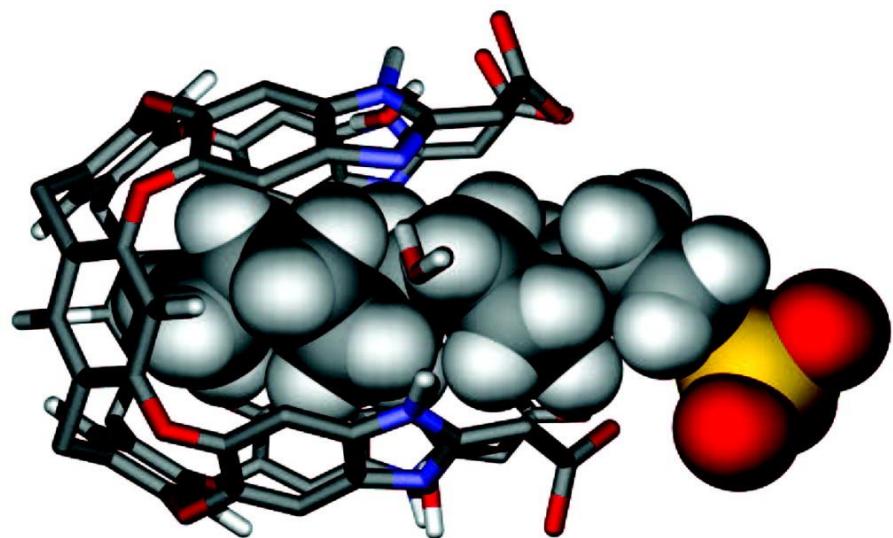

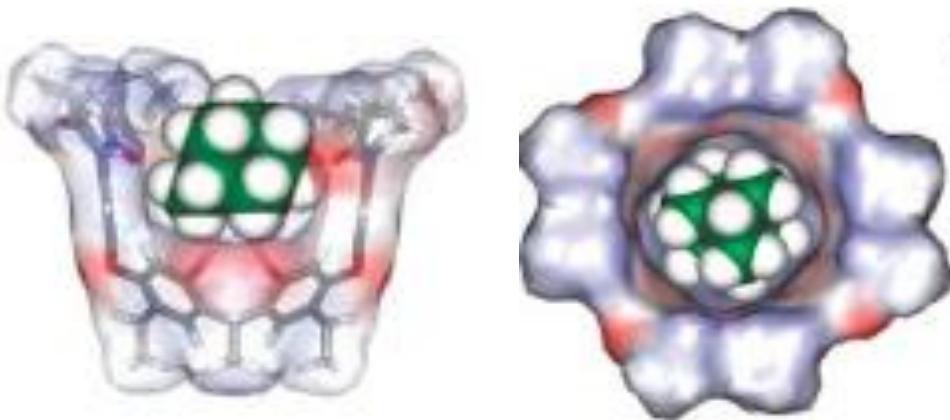

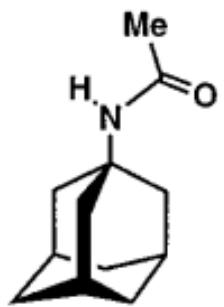

(B)

(C)

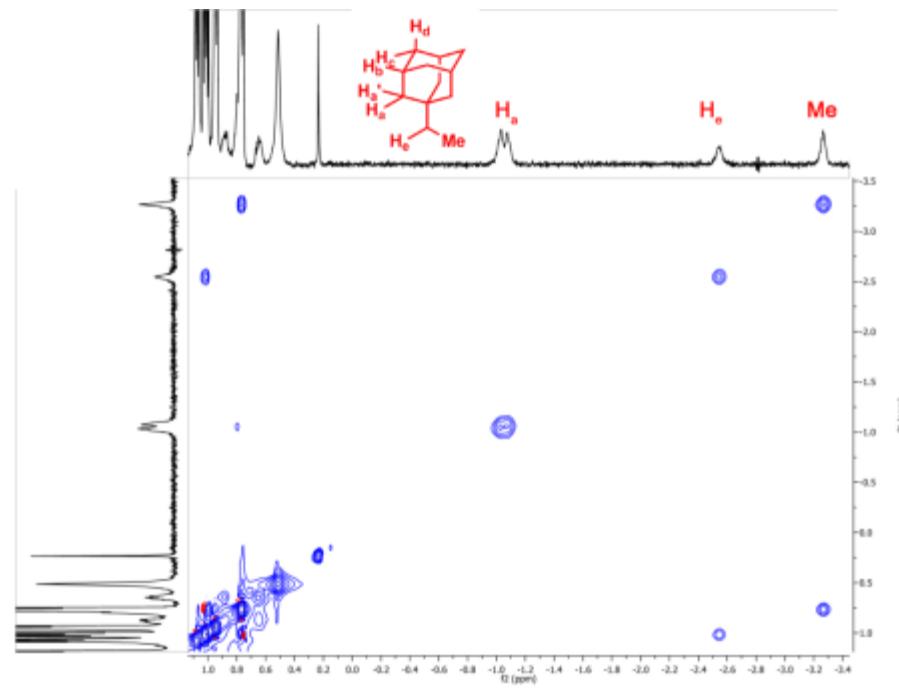

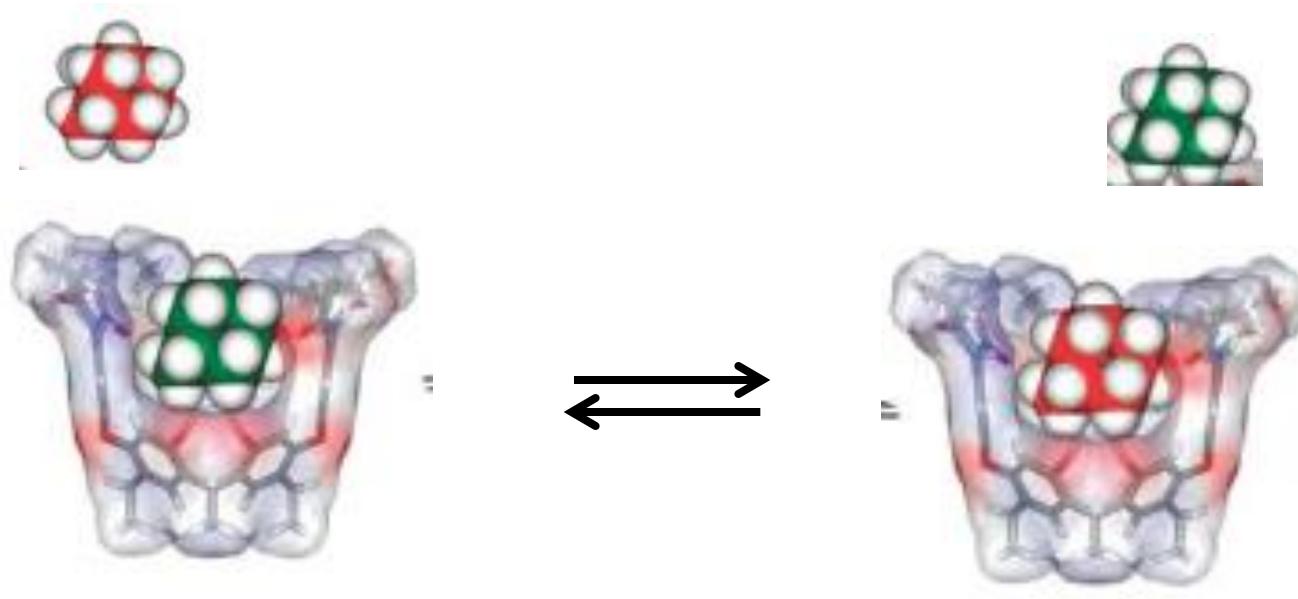

Stabilità migliaio di kcal/mol

2D NOESY accoppiamenti di vicinanza spaziale tra cavitando e bound guest

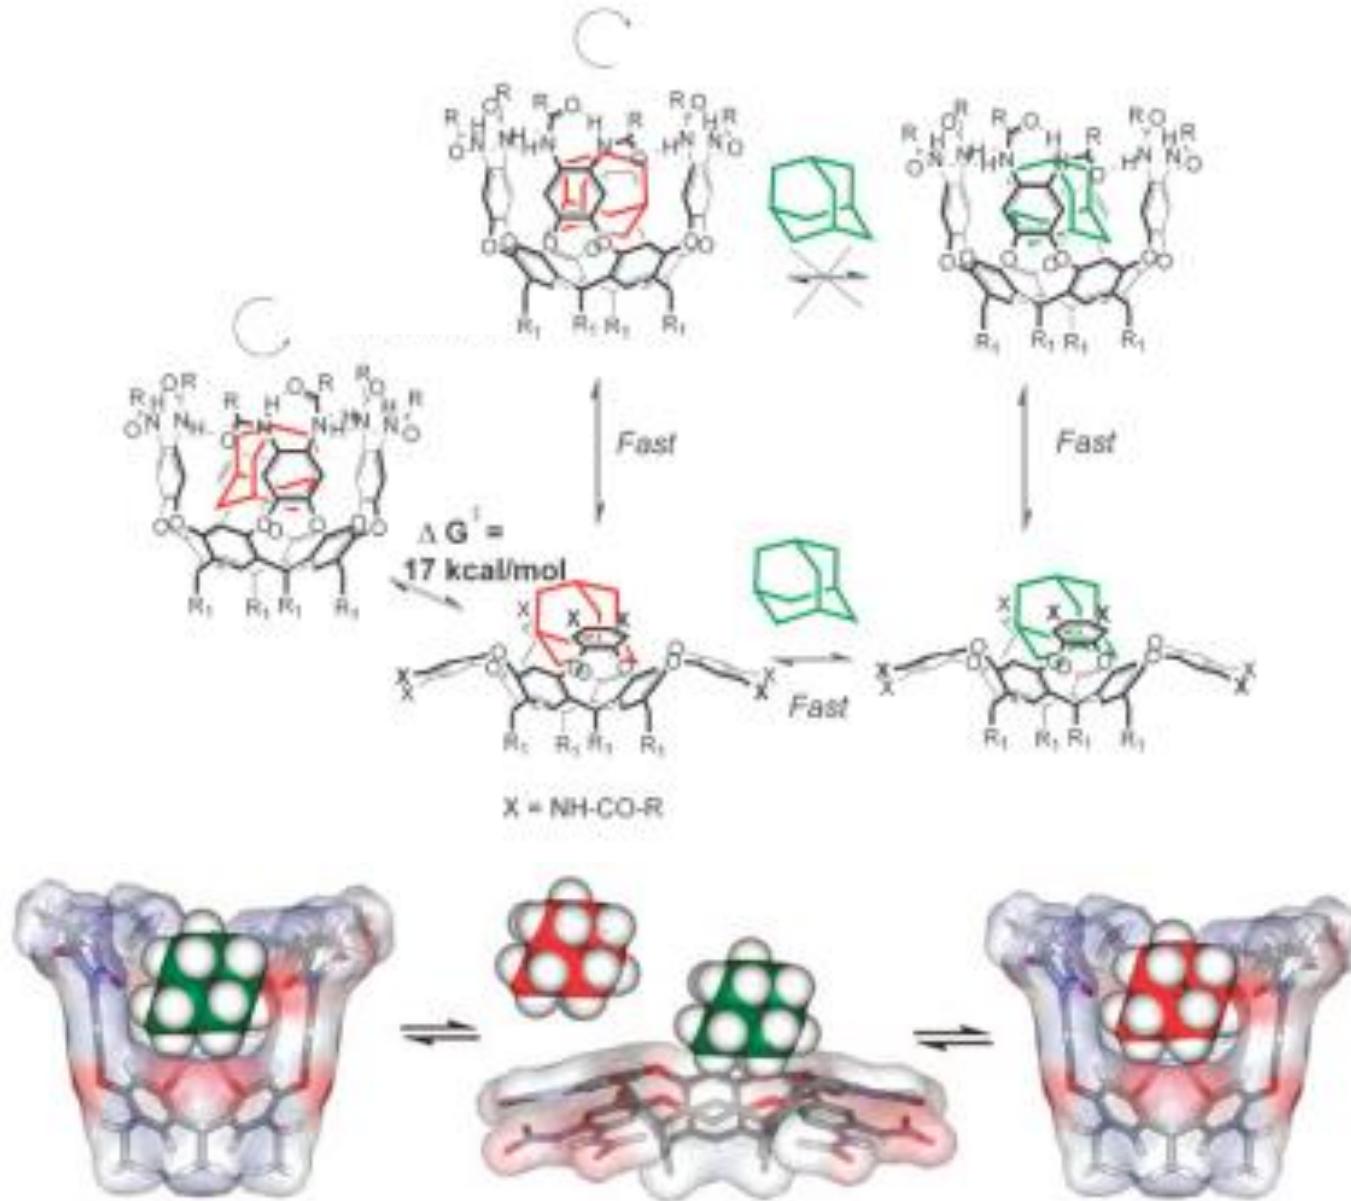

In eccesso di guest: segnali NMR distinti per free and bound guest + evidenza di scambio da 2D EXSY

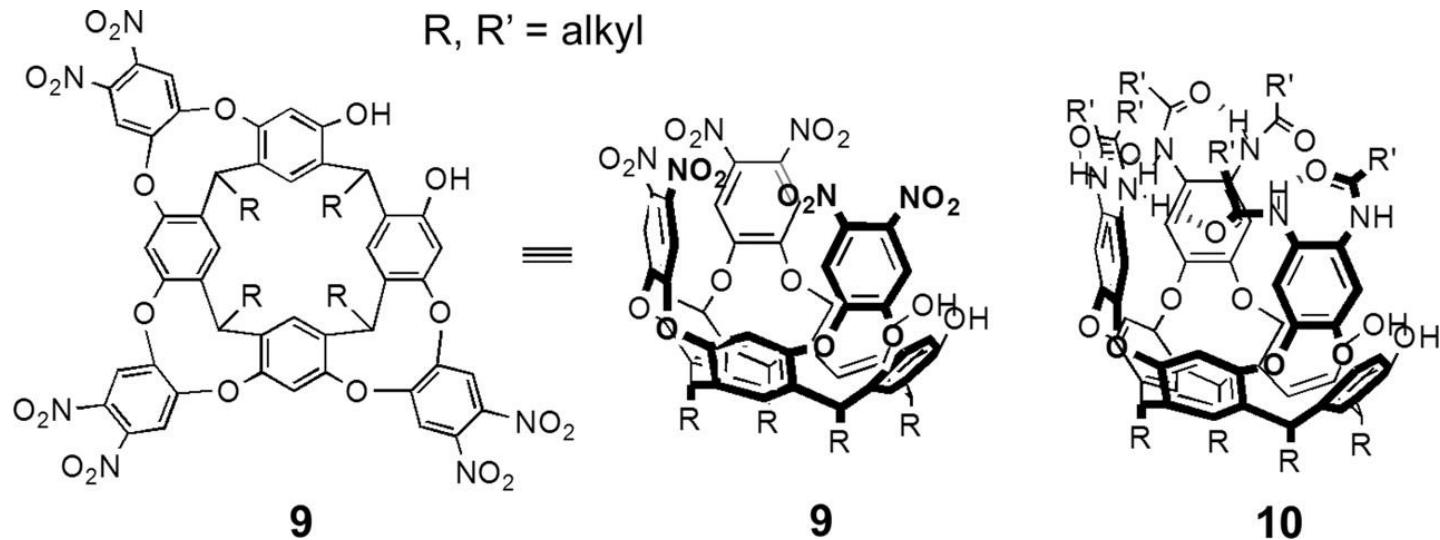

Scambio lento nella scala dei tempi NMR!!

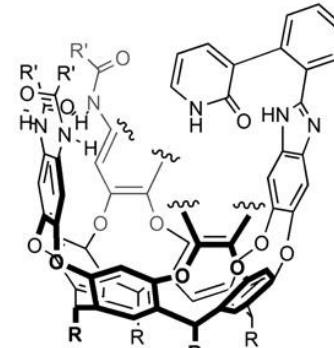

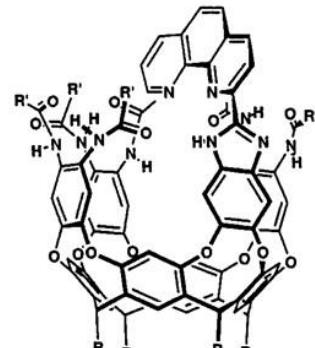

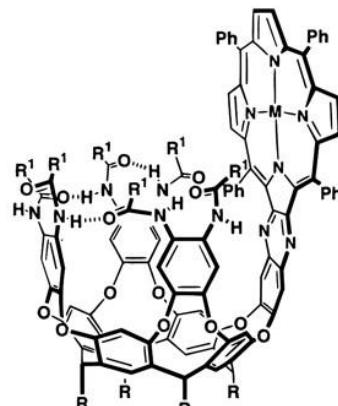

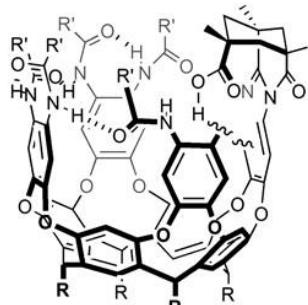

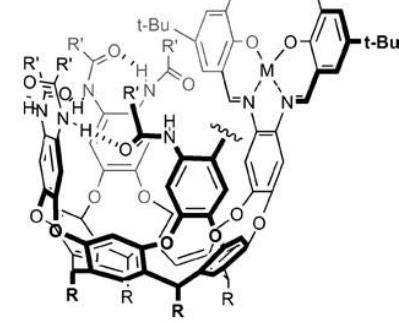

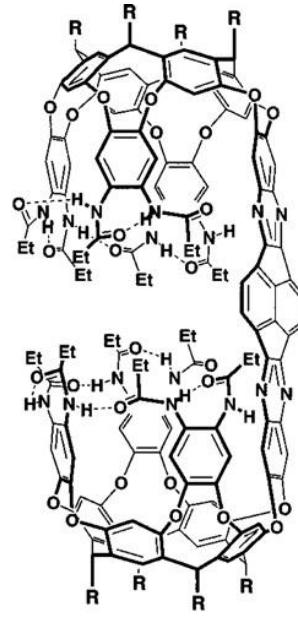

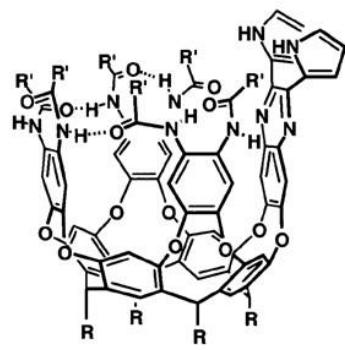

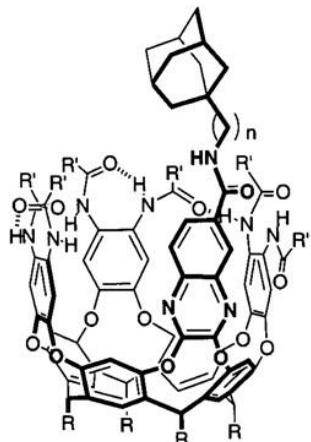

Misura della cinetica di scambio (VT NMR): barriera cinetica di scambio di ca. 17 kcal mol⁻¹

Cavitandi funzionali?

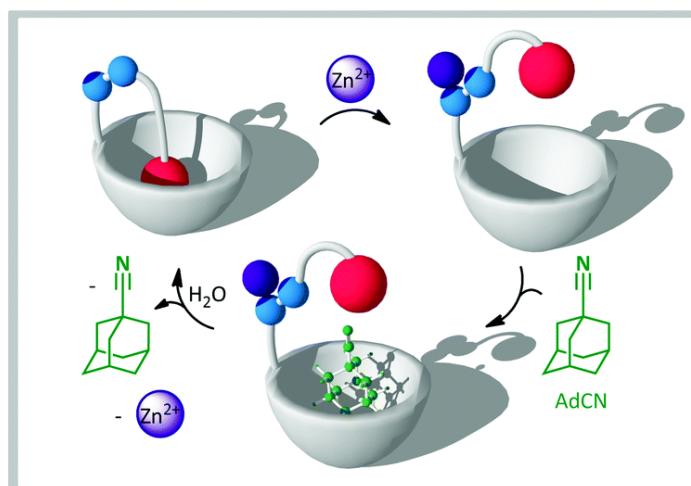

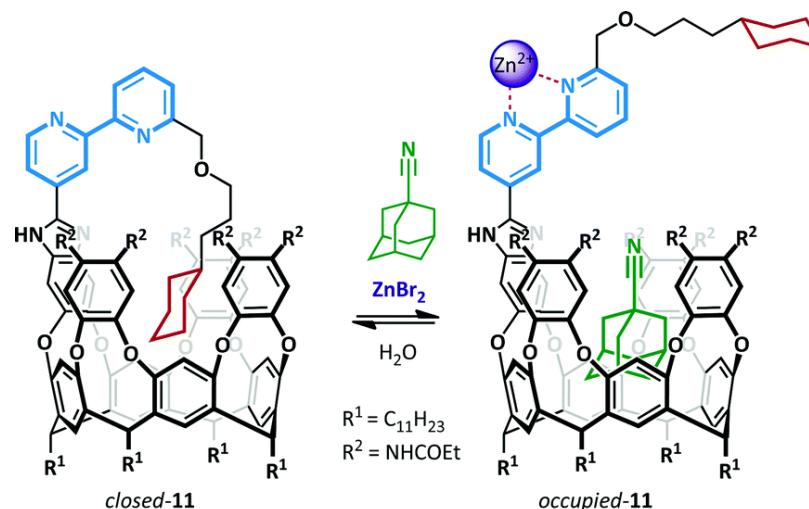

From the hexanitro precursor **9**, encountered as side-product in the preparation of the octanitro derivative, reduction and acylation to obtain hexamide **10**, followed by addition of the fourth wall and reduction to the diamine affords the common precursor to monofunctionalized cavitands.

The Ouroborand: A Cavitand with a Coordination-Driven Switching Device**

Recettori per molecole neutre

Effetto idrofobico esterno polare (e/o carico) tasca idrofobica

Ciclodestrine – unità D-glucopyranosidiche (legami 1,4-glicosidici)

$n=6$ α -cyclodextrin
 $n=7$ β -cyclodextrin
 $n=8$ γ -cyclodextrin

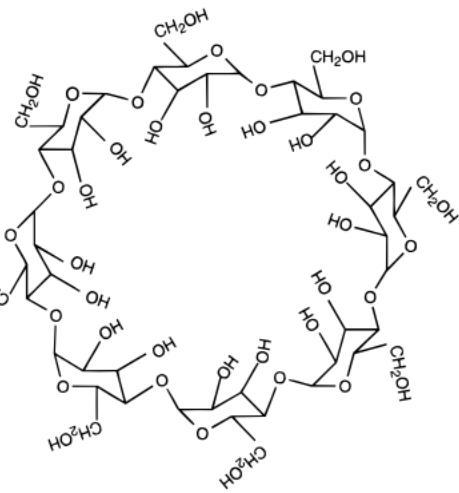

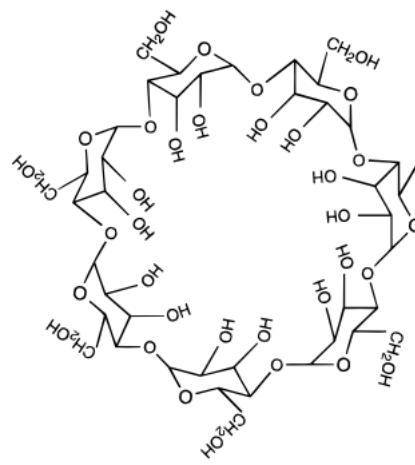

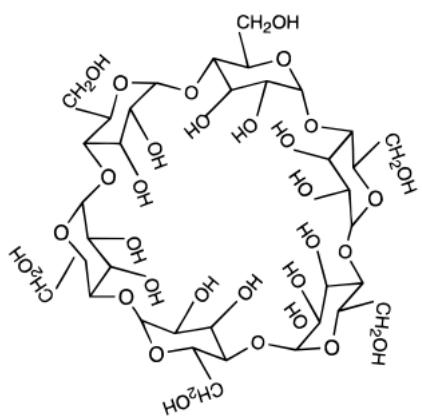

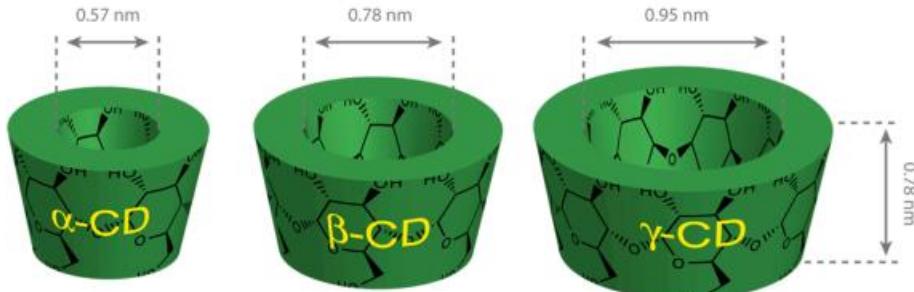

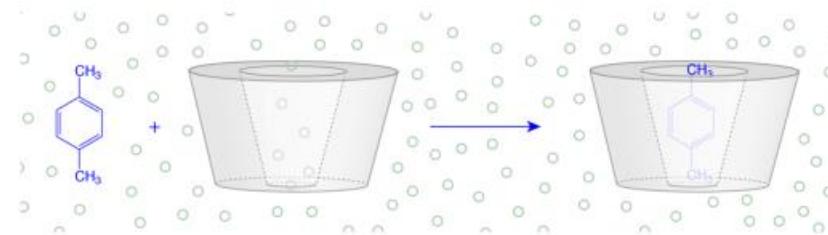

Table 1. Recap of the Main Results of Freudenberg on Schardinger Dextrins

year	result
1922	tosylated dextrins
1930	Schardinger dextrins: laboratory curiosities and/or unwanted byproducts of starch degradation Schardinger dextrins: chain molecules intermediate between maltose and starch
1935	the dextrins were lined with a hydrocarbon interior synthesis of Schardinger dextrins with high purity determination of molecular weights (five for α -dextrin and six for β -dextrin) solubility differences of the dextrins chemical modification of dextrins (acetylation, methylation, saponification reactions)
1936	studies on the nature of the glycosidic bonds hypothesis on the cyclic nature
1938	cyclic chemical structure of dextrins hydrophobicity of the inner surface of the dextrins ability to form inclusion complexes Foundation of the Research Institute for the Chemistry of Wood and Polysaccharides
1939	description of the mechanism of action for <i>Bacillus macerans</i>
1943	cyclic structure composed of maltose units bound together by $\alpha(1 \rightarrow 4)$ glycosidic linkages
1947	the first scheme for the isolation of pure fractions
1948	discovery of γ -dextrin Freudenberg and Cramer demonstrated their conclusions on cyclic structure using optical activity data the first indication of the existence of dextrins comprising more than 8 glycosyl units
1950	structure of γ -dextrin involvement of hydrophobic forces in the formation of the complexes possible existence of dextrins with 9 or 10 units of glucose
1953	first patent concerning applications in pharmaceutical formulations

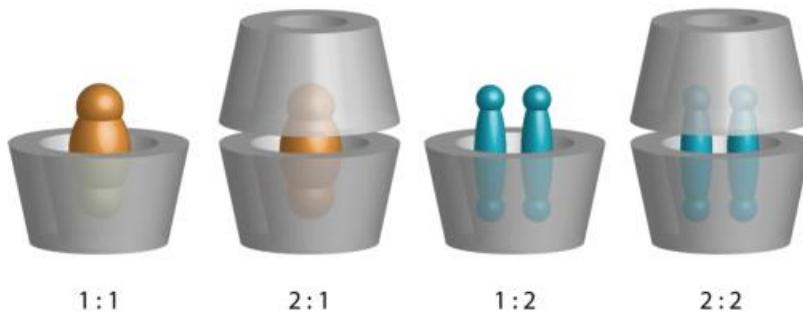

Solubilità (H_2O):

α 145g/L β 18.5 g/L γ 232 g/L

Size-fit, effetto idrofobico, vdW, dipolo-dipolo, legami a idrogeno..

Complessi 1/1 o con varie stechiometrie

Derivatizz tramite gruppi OH:
alkyl/hydroxyalkyl/carboxyalkyl/ester/thiol/tosyl/...

non toxic...termostabili..airstable...

Production 1000 tons/year

Settori applicativi:

Farmaceutico: stabilità (luce aria). Biodisponibilità, formulazione, somministrazione..

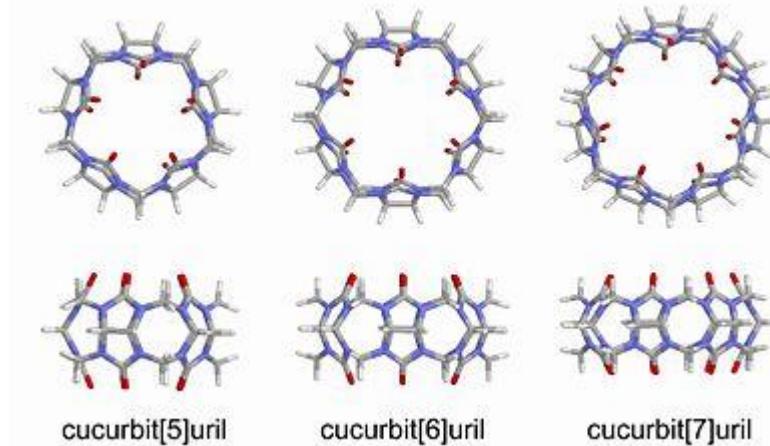

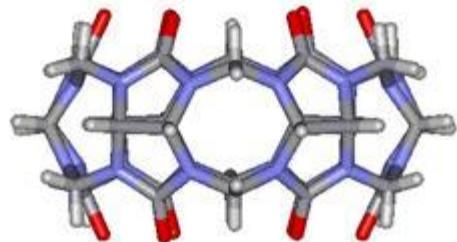

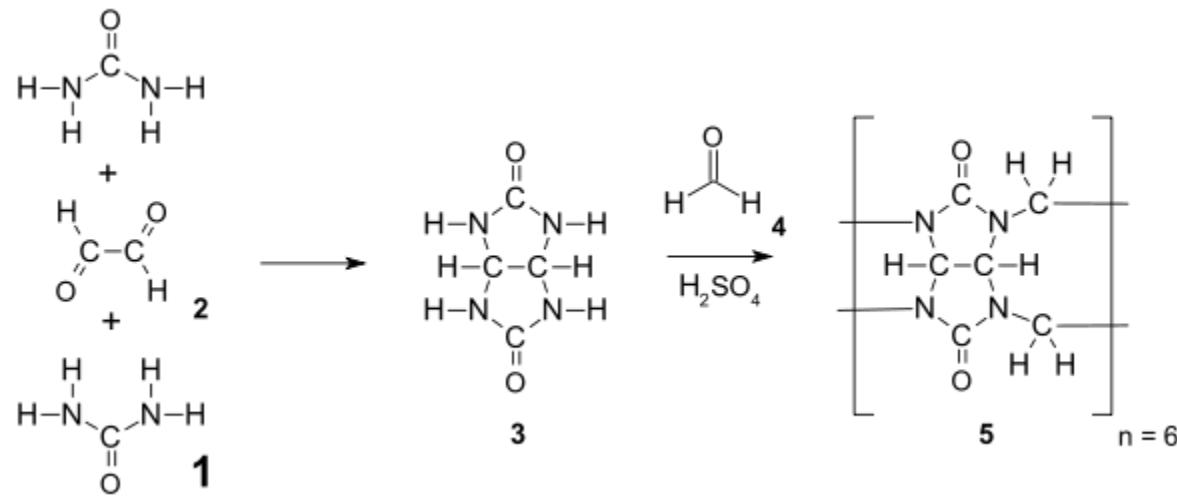

Alimentare: aromi, spezie, emulsioni, colesterolo, vitamine

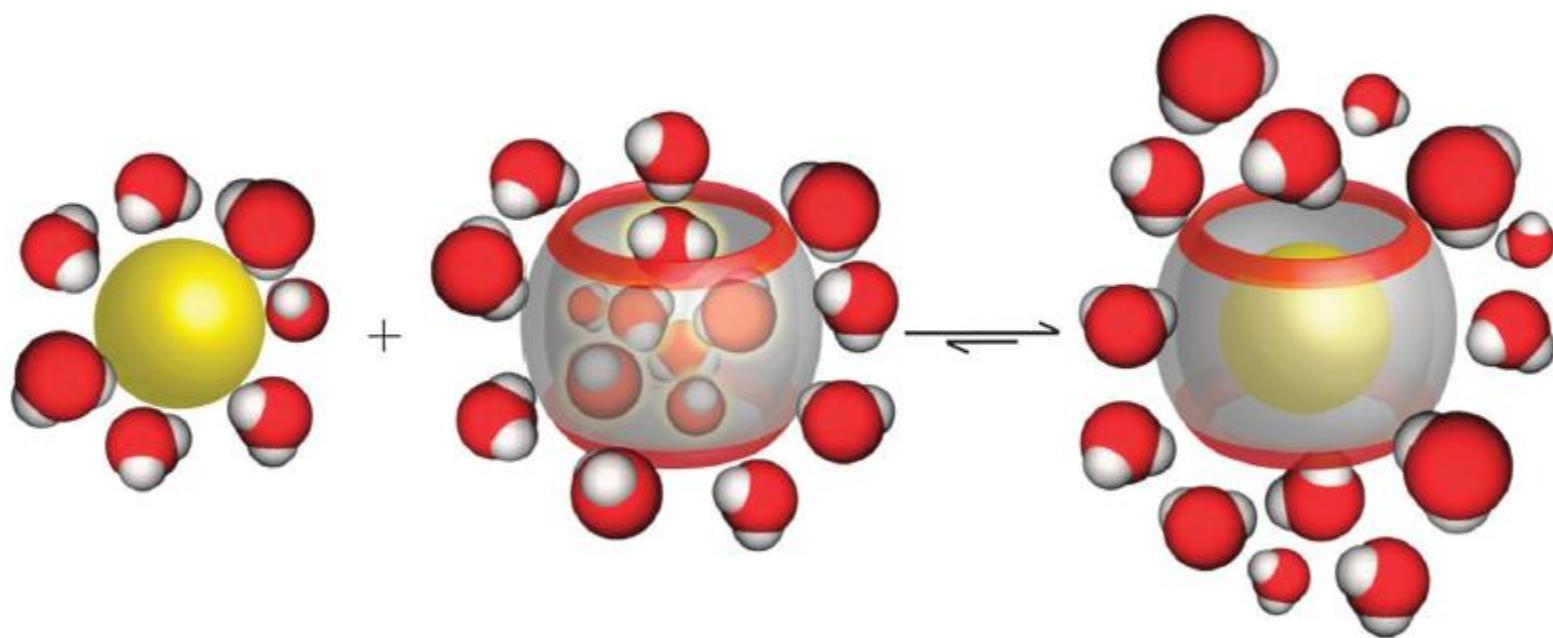

Cosmetico: lozioni solari

Analitici: grafting su supporti polimerici x cromatografia (HPLC chirale)
