

Game Theory

Basic Concepts

- *Game* – a situation in which strategic behaviour is an important part of decision making
- *Players* – the decision makers in game
- *Actions & Strategies* – a player's plan of actions in a game
- *Payoffs* – the rewards enjoyed by a player at the end of a game
- Is Cooperation allowed?
- Information and common Knowledge

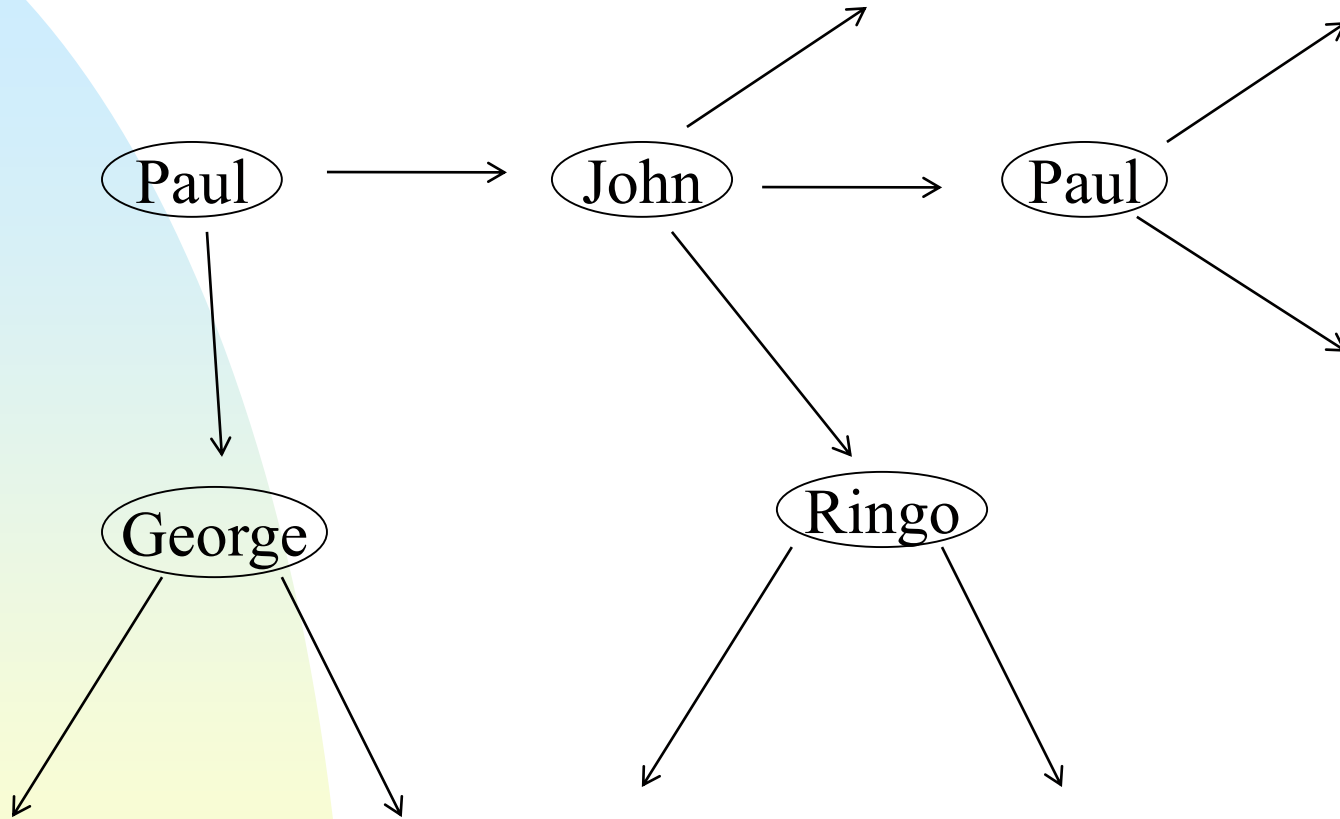

Simultaneous v. Sequential Move Games

- Games where players choose actions simultaneously are simultaneous move games.
 - Must anticipate what your opponent will do right now, recognizing that your opponent is doing the same.

Simultaneous v. Sequential Move Games

- Games where players choose actions in a particular sequence are sequential move games.
 - Examples: Chess, Bargaining/Negotiations.
 - Must look ahead in order to know what action to choose now.
 - Many sequential move games have deadlines/ time limits on moves.
- Many strategic situations involve both sequential and simultaneous moves.

Sequential game

Strategies

- A *strategy* must be a “comprehensive plan of action”, a decision rule or set of instructions about which actions a player should take
- It is the equivalent of a memo, left behind when you go on vacation, that specifies the actions you want taken in every situation which could conceivably arise during your absence.
- Strategies will depend on whether the game is one-shot or repeated.

One-Shot versus Repeated Games

- One-shot: play of the game occurs once.
 - Players likely to not know much about one another.
 - Example - tipping on your vacation
- Repeated: play of the game is repeated with the same players.
 - Indefinitely versus finitely repeated games
 - Reputational concerns matter; opportunities for cooperative behavior may arise.

Information

- Players have *complete information* if they know exactly all the rules of the game, with payoffs and strategies available to all the other players
- If it is also known what moves others have made before them, than information is *perfect* (as in sequential games e.g. in Chess)

Game description

- *A standard or Normal form* – relates summary strategy to payoffs (simultaneous moves)
- *Extensive form or Game tree* – a graphical representation of individual moves by players

The Prisoners' Dilemma

Bonnie's Decision

Confess

Remain Silent

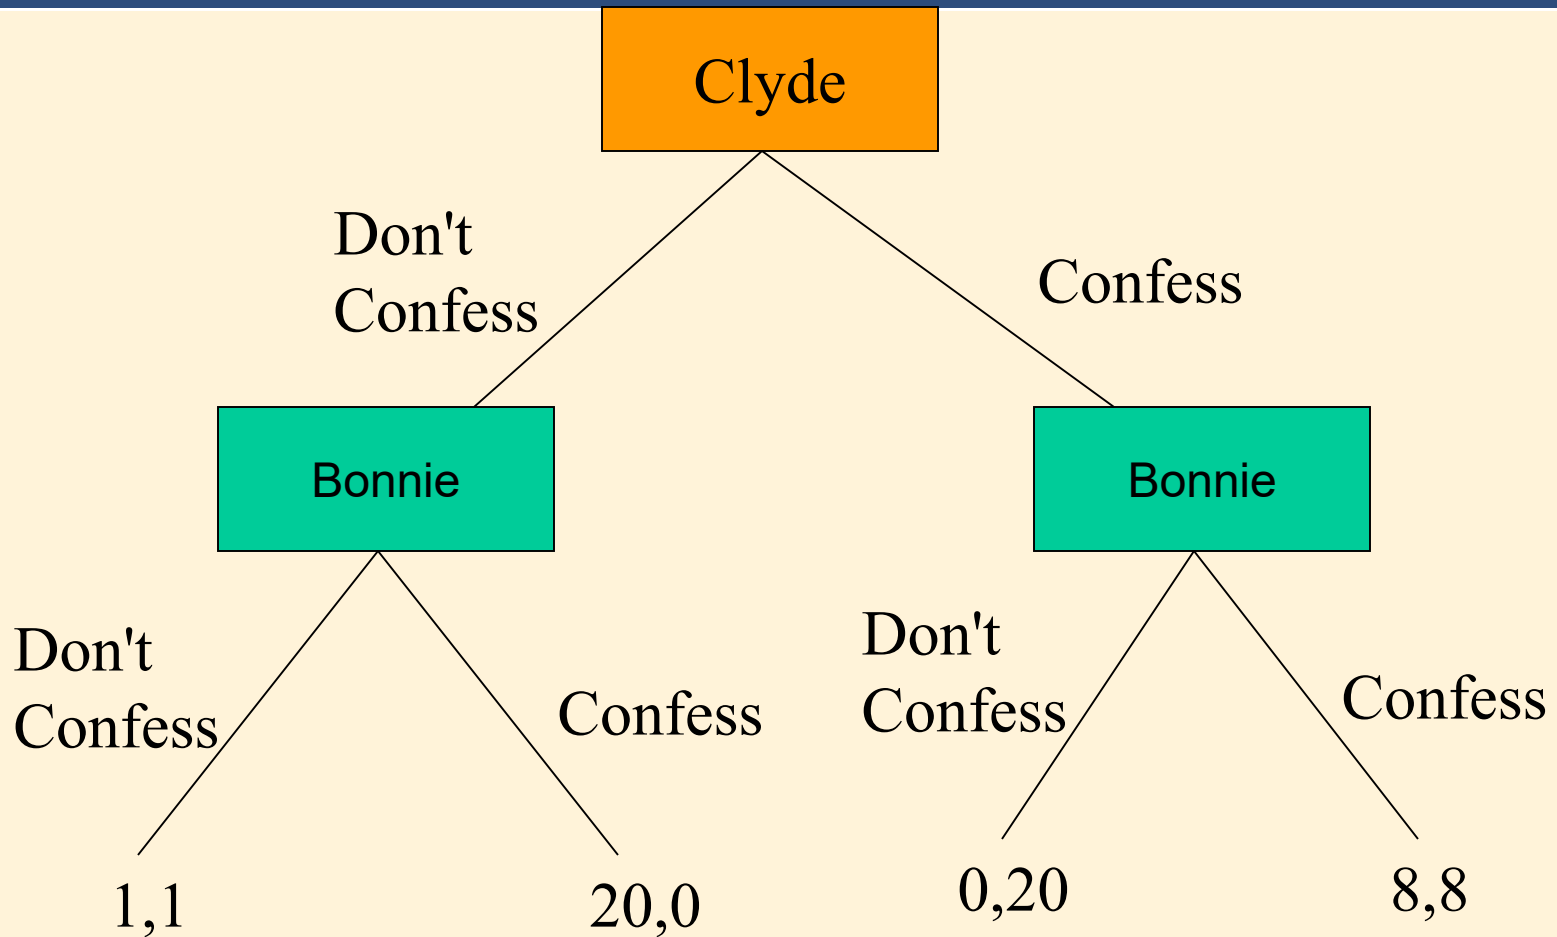

Confess

**Clyde's
Decision**

**Remain
Silent**

<p>Bonnie gets 8 years</p> <p>Clyde gets 8 years</p>	<p>Bonnie gets 20 years</p> <p>Clyde goes free</p>
<p>Bonnie goes free</p> <p>Clyde gets 20 years</p>	<p>Bonnie gets 1 year</p> <p>Clyde gets 1 year</p>

Prisoners' Dilemma Game in "Extensive" Form

Prisoner dilemma

Dominant strategy – a strategy that works at least as well as any other one, no matter what any other player does

In the prisoner dilemma such a dominant strategy is....

to confess

Bonnie's Decision

Confess

Remain Silent

Confess

Clyde's Decision

	Confess	Bonnie gets 8 years Clyde gets 8 years	Bonnie gets 20 years Clyde goes free
Remain Silent	Bonnie goes free Clyde gets 20 years	Bonnie gets 1 year Clyde gets 1 year	

We don't need a solution concept but the less the better

- *Can you apply this framework to other issues?*

An Arms-Race Game

Decision of the United States (U.S.)

Arm

Disarm

Arm

Decision
of the
Soviet Union
(USSR)

Disarm

U.S. at risk	U.S. at risk and weak
USSR at risk	USSR safe and powerful
U.S. safe and powerful	U.S. safe
USSR at risk and weak	USSR safe

A Common-Resource Game

		Exxon's Decision	
		Drill Two Wells	Drill One Well
Texaco's Decision	Drill Two Wells	Exxon gets \$4 million profit Texaco gets \$4 million profit	Exxon gets \$3 million profit Texaco gets \$6 million profit
	Drill One Well	Exxon gets \$6 million profit Texaco gets \$3 million profit	Exxon gets \$5 million profit Texaco gets \$5 million profit

An Advertising Game

		Marlboro's Decision	
		Advertise	Don't Advertise
Others' Decision	Advertise	Marlboro gets \$3 billion profit they get \$50 billion profit	Marlboro gets \$2 billion profit they get \$51 billion profit
	Don't Advertise	Marlboro gets \$5 billion profit they get \$48 billion profit	Marlboro gets \$4 billion profit they get \$50 billion profit

The image shows a 2x2 payoff matrix for an advertising game. The columns represent Marlboro's decision (Advertise or Don't Advertise) and the rows represent Others' decision (Advertise or Don't Advertise). Each cell contains the profit for Marlboro and the profit for Others. A red circle highlights the top-left cell, where both parties choose to advertise.

		Marlboro's Decision	
		Advertise	Don't Advertise
Others' Decision	Advertise	Marlboro gets \$3 billion profit they get \$50 billion profit	Marlboro gets \$2 billion profit they get \$51 billion profit
	Don't Advertise	Marlboro gets \$5 billion profit they get \$48 billion profit	Marlboro gets \$4 billion profit they get \$50 billion profit

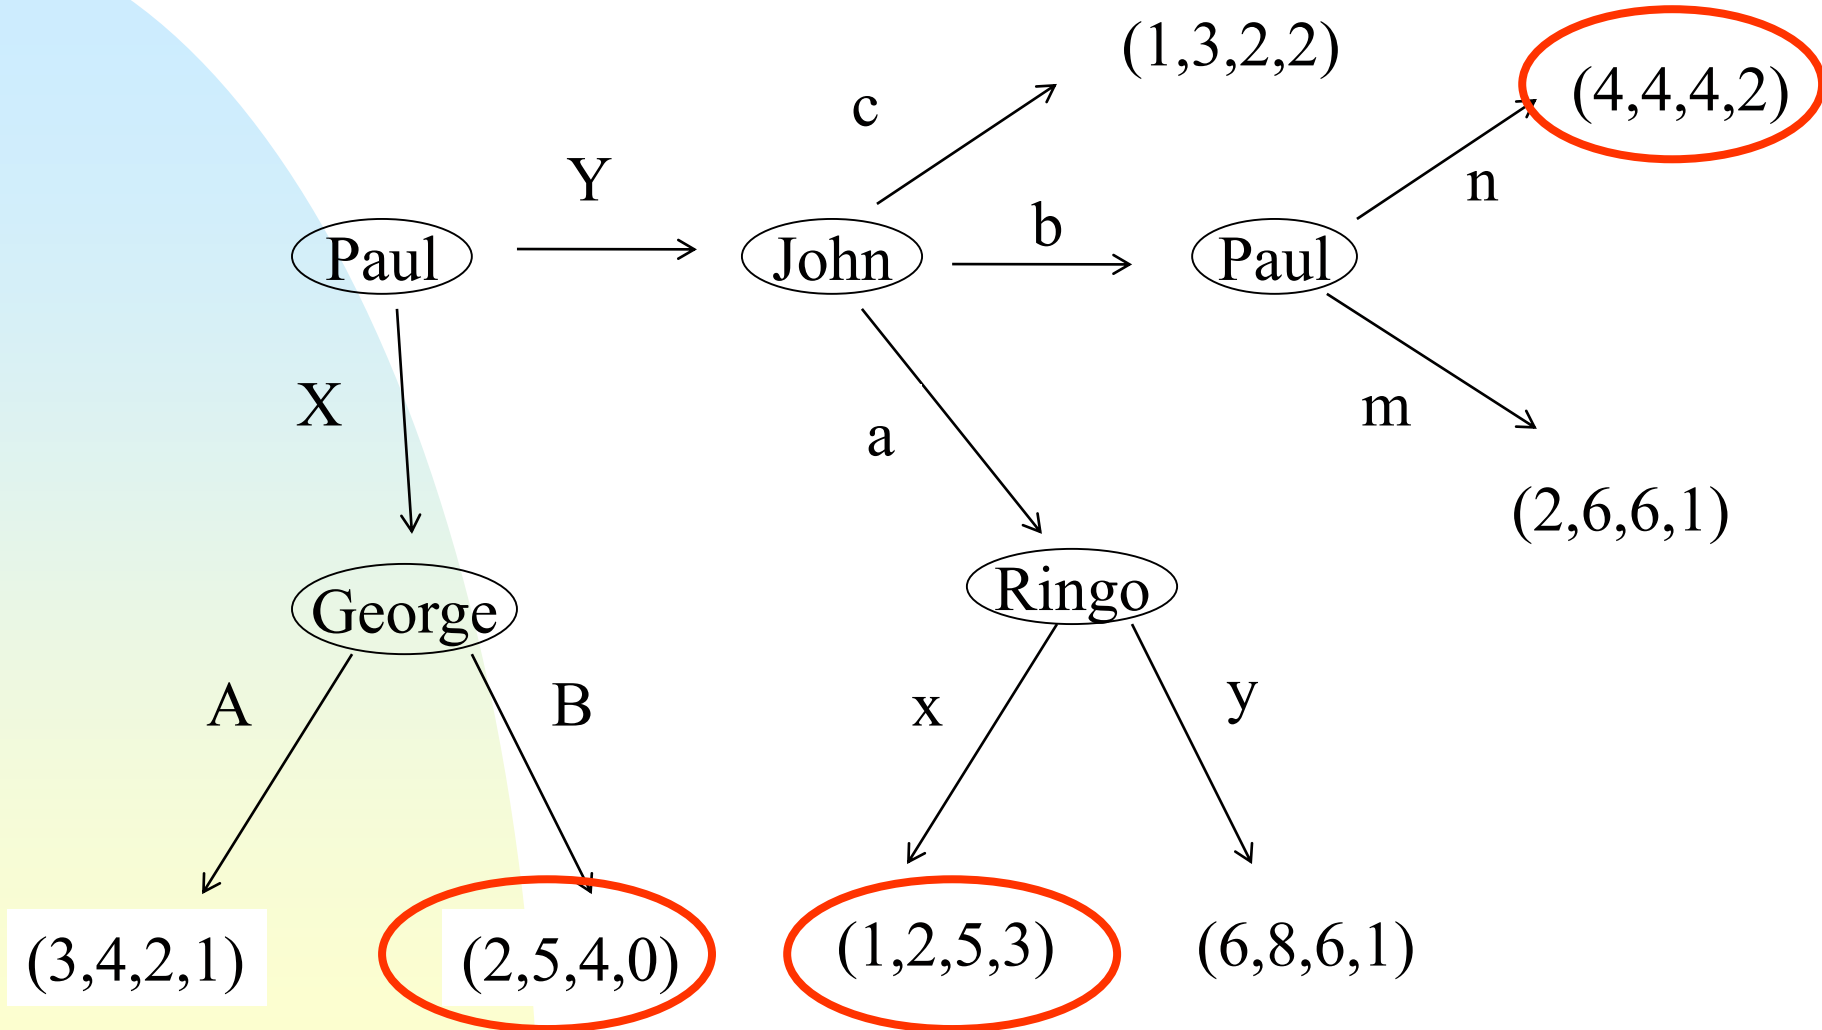

A dominant strategy

- Can be recognized in sequential games when you PRUNE the tree
- So you can solve the game!
- In the Beatles game payoffs refer to players in the very same order

Paul, George, John and Ringo

Paul, John, George and Ringo

What about me and you?????

	talk	video	silent
stay	6,7	3,5	0,5
leave	5,4	5,3	6,5

Column 1 dominates column 2

	talk	video	silent
stay	6,7	3,5	0,5
leave	5,4	5,3	6,5

So you can erase column 2! Then?

	talk	silent
stay	6,7	0,5
leave	5,4	6,5

I need a device since there is
no dominant strategy

Nash equilibrium - If each player has chosen a strategy and no player can benefit by changing his strategy while the other players keep theirs unchanged, then the current set of strategy choices and the corresponding payoffs constitute a Nash equilibrium

2 NASH equilibria!

	teach	silent
stay	6,7	0,5
leave	5,4	6,5

2 nash equilibria too....

Nash equilibrium

The Nash equilibrium can be seen as the only sustainable outcome of rational negotiation in the absence of externally enforceable agreements:

There is no free riding!

Thus, in equilibrium, no one has an incentive to change his strategy given the strategy choices of all others.

Nash Equilibrium

- In equilibrium, each player is playing the strategy that is a "best response" to the strategies of the other players, that is the strategy that yields the highest payoff given the strategies of the other players.

It nonetheless requires that other players will use the same information in a rational way and everybody is optimizing his/her behaviour

Did you watch the movie “ a beautiful mind”?

to confess is a NASH equilibrium too

Bonnie's Decision

Confess

Remain Silent

Confess

Clyde's Decision

Remain Silent

	Bonnie gets 8 years Clyde gets 8 years	Bonnie gets 20 years Clyde goes free
	Bonnie goes free Clyde gets 20 years	Bonnie gets 1 year Clyde gets 1 year

Nash Equilibrium

- Nash Equilibrium does not mean:
 - The best possible outcome. Equilibrium in the one-shot prisoners' dilemma is for both players to confess ,while they prefer to walk away as soon as possible
 - Nash is not easy to accept...

MARKETS WITH ONLY A FEW SELLERS

- Characteristics of an Oligopoly Market
 - Few sellers offering similar or identical products
 - Interdependent firms
 - Best off cooperating and acting like a monopolist by producing a small quantity of output and charging a price above marginal cost

Competition, Monopolies, and Cartels

- The oligopolists may agree on a monopoly outcome.
 - *Collusion*
 - An agreement among firms in a market about quantities to produce or prices to charge.
 - *Cartel*
 - A group of firms acting in unison.
- Although oligopolists would like to form cartels and earn monopoly profits, often that is not possible. Antitrust laws prohibit explicit agreements among oligopolists as a matter of public policy.

Cartels

- Is the oil market a competitive one?
- The Organization of Petroleum Exporting Countries (OPEC) was formed in 1960 with five founding members Iran, Iraq, Kuwait, Saudi Arabia and Venezuela. By the end of 1971 six other nations had joined the group: Qatar, Indonesia, Libya, United Arab Emirates, Algeria and Nigeria.
- What about Russia?

Low price (=low profit) is a NASH equilibrium too.
Do you like it?

		B's Decision	
		High Price	Low Price
A's Decision	High Price	B gets 100 billion A gets 100 billion	B gets 120 billion A gets -20 billion
	Low Price	B gets -20 billion A gets 120 billion	B gets 50 billion A gets 50 billion

What about playing this game twice? Today and next year?

B's Decision

High Price

Low Price

High Price

B gets 100 billion

B gets 120 billion

A gets 100 billion

A gets -20 billion

B gets -20 billion

B gets 50 billion

Low Price

A gets 120 billion

A gets 50 billion

A's Decision

	High Price	Low Price
High Price	B gets 100 billion A gets 100 billion	B gets 120 billion A gets -20 billion
Low Price	B gets -20 billion A gets 120 billion	B gets 50 billion A gets 50 billion

Is cooperation feasible?

- Folk theorem states that cooperation (high price) is viable when this game will go on forever
- When you don't know when the game will be over maybe you can maintain high prices strategy forever

But if you know when

This game will be over:

will you cooperate the very last time you will see
your opponent?

and the time before???

TIT FOR TAT

- Axelrod (1984) asked several economists, mathematicians experts in social sciences to provide a strategy for an iterated prisoner's game, i.e. without knowing when it stops
- These strategies were matched and the game played long enough to see emerging the winning strategy: TIT FOR TAT
- You start cooperating, but you retaliate (next time) if your opponent defects now. If he'll cooperate again then you will cooperate too.

Is it strange?

BitTorrent peers use tit-for-tat strategy to optimize their download speed.

More specifically, most BitTorrent peers use a variant of Tit for two Tats which is called *optimistic unchoking*.

BitTorrent peers have a limited number of upload slots to allocate to other peers.

Is it strange?

Consequently, when a peer's upload bandwidth is saturated, it will use a tit-for-tat strategy. Cooperation is achieved when upload bandwidth is exchanged for download bandwidth. Therefore, when a peer is not uploading in return to our own peer uploading, the BitTorrent program will *choke* the connection with the uncooperative peer and allocate this upload slot to a hopefully more cooperating peer.

Is cooperation feasible?

- If deadline is known a rational player will defect at the end, and working back he/she will defect the time before too
- And the time before and before
- This is backward induction the can be used to solve the repeated Prisoners' dilemma and restore the standard solution
- but cooperation can emerge if will be together for a LONG (UNKNOWN) TIME

Another way to enforce cooperation is: increase options!
