

1

Thinking of your first experience with TDD...

What was easy?

Write the algorithm

Steps was clear and the problem to solve was not difficult

Verifying all conditions

Writing code to pass tests

The fizzbuzz assignment

Implementation

Having clear steps to follow

Implementation

It was fair

What was challenging?

Understanding gradle

Finding good test and debug thinks about the ide

For complicated tasks finding an intermediate test

Writing the proper tests

Thinking of all the useful tests to perform

Finding the right tests

What was different?

Try the edge cases not with "hand", using the main

Testing all atomic features and not the overall program in one shot

More methodical approach

Lot of commits and refactoring

Testing the output without printing over and over in the main

Time spent designing

No need to think all before

Methodical

Slower

2

Should you always practice
TDD?
