# BOTTOM SAMPLING SYSTEMS

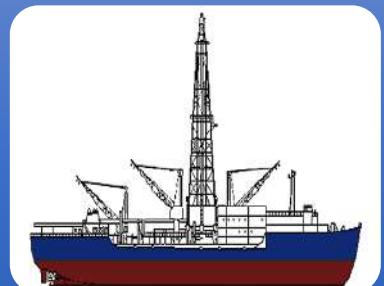

## Gravity corer

- classic gravity corer (Emery and Dietz, 1941; Hvorslev and Stetson, 1946)
- box corer
- kastenlot corer
- multi-corer

## Piston corer

- classic piston corer (Kullenberg, 1947; 1955)
- long piston corer
  - Calypso piston corer (e.g. R/V Marion Dufresne, G.O. Sars)
  - Jumbo piston corer (e.g. R/V Araon)

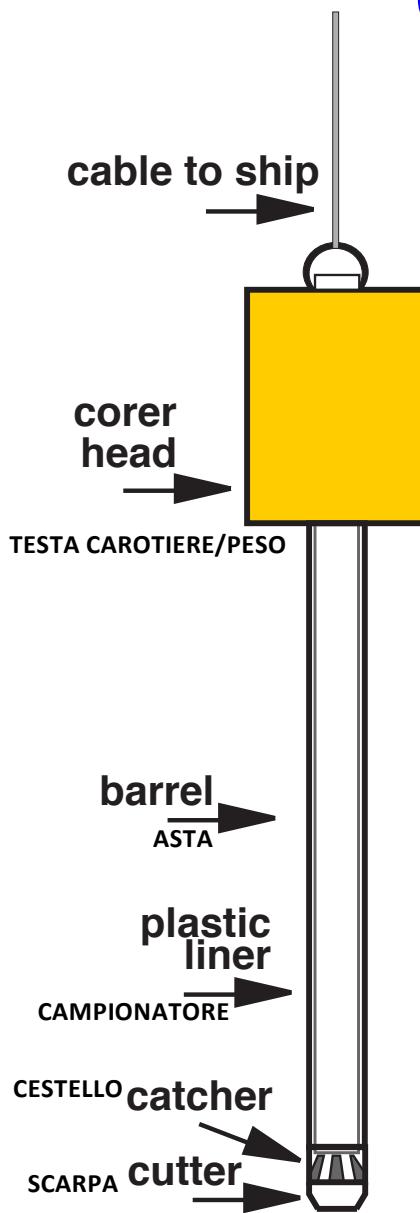

## Drilling systems

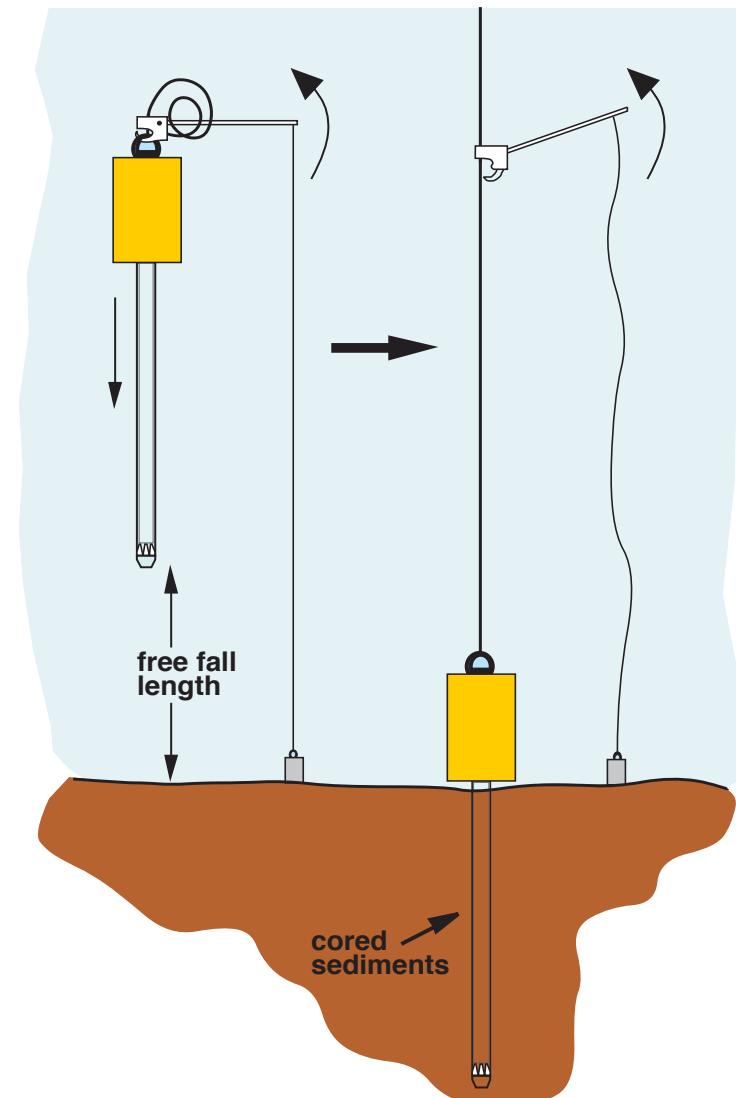

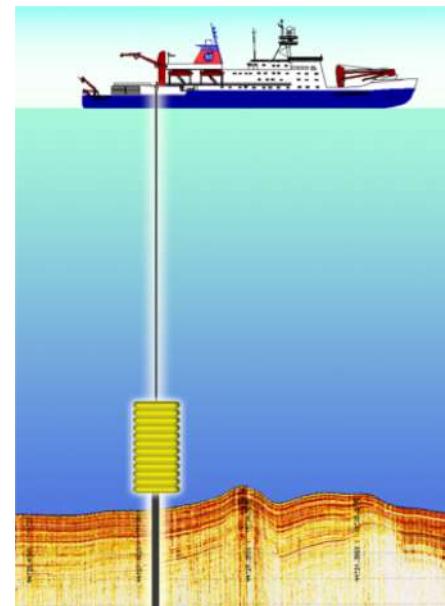

- ocean floor drilling systems (e.g. IODP-drilling vessels & semi-automated MeBo system)
- ice drilling systems (e.g. EPICA-European Project for Ice Coring in Antarctica & NorthGRIP- North Greenland Ice Core Project)

## Classic gravity core system (Emery and Dietz, 1941)

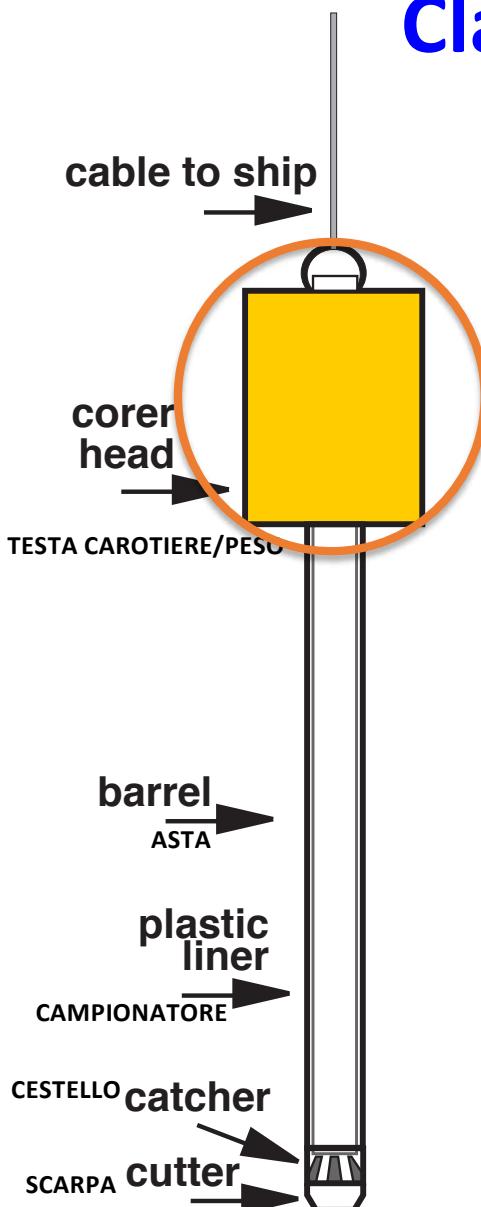

It is the simplest coring device in which the weight of the coring equipment is used to force the barrel into the sea bottom. This system can work with or without a triggering system (sistema di sgancio).

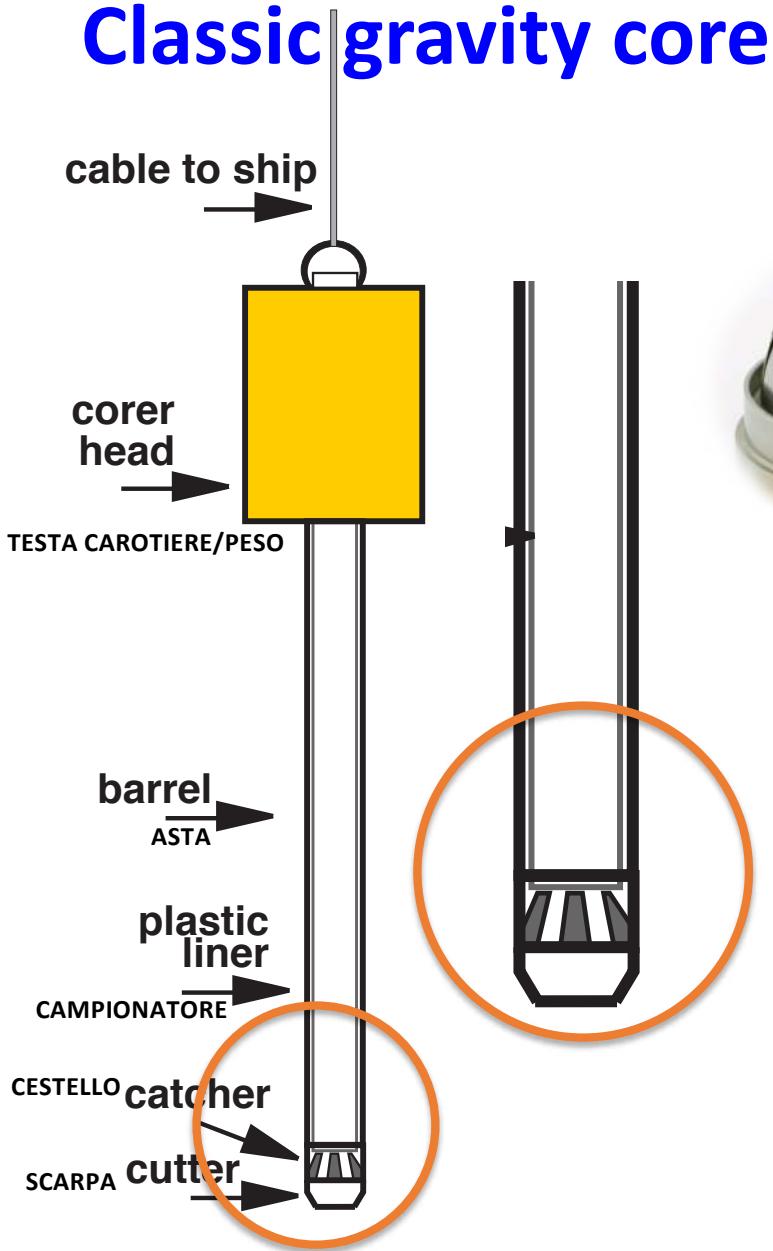

## Classic gravity core system: corer head

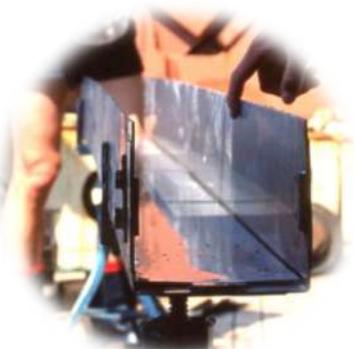

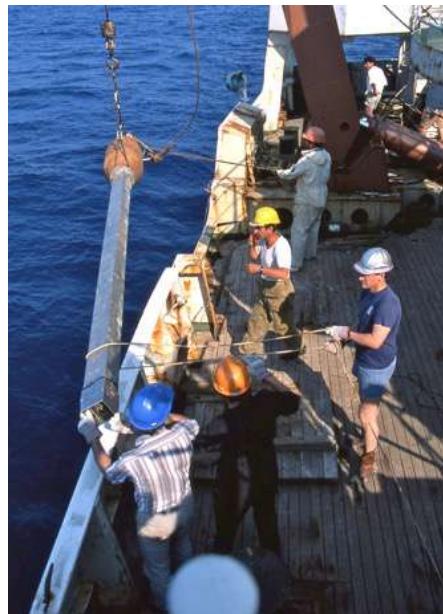

weigth 600-800 kg  
6000 kg

# Classic gravity core system: core catcher and cutter

## Additional gravity core systems: Kastenlot corer

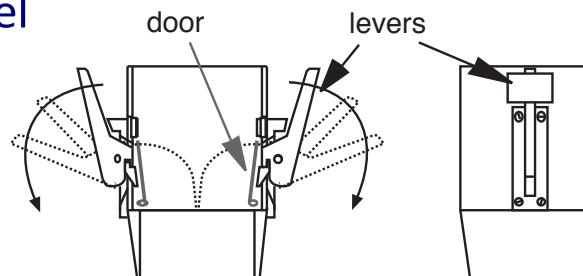

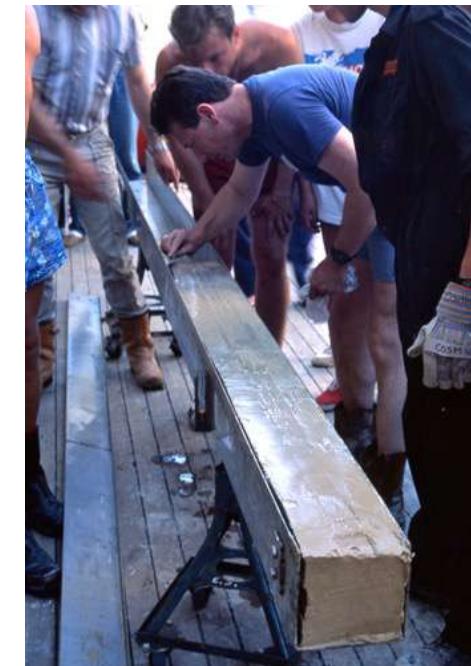

The kastenlot (kastens) corer was originally designed by Kögler (1963) it was improved and modified by Zanger and McCave (1990). The barrel, of variable lengths, is square in section (15x15 cm) and it contains a **base plate** that can be raised to reveal a new cleaned core surface

Square section  
of barrel

Core cutter and catcher

Head of  
kastens  
corer

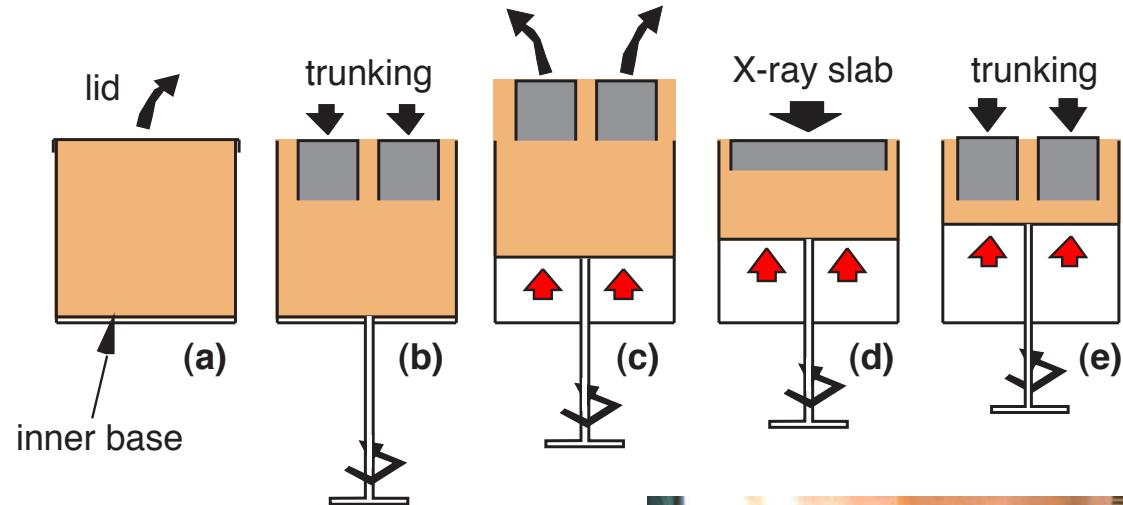

The core catcher has a **shutter-like closure** consisting of two square doors held under tension and blocked in a retracted position by two levers located on the outside. During the corer pullout, the pressure of the surrounding sediments pushes down the two levers closing the doors.

- (a) removal of the barrel lid to reveal the core surface;
- (b) two PVC trunkings are pushed into the sediments
- (c) the inner base is moved upward to expose the trunkings that are cut at the base and removed from the main core using a cheese wire;
- (d) sampling with x-ray slabs, and a further set of trunkings (e). Each time the sediments are lifted upward and withdrawn with a cheese wire

## Sampling of Kastens cores

## Additional gravity core systems: BOX-corer

Designed for minimum disturbance of the sediment surface, ideal for coarse/stiff sea floor sediments, it allows the recovery of bottom waters.

lateral surface

coral sampling

sampling of  
glaciogenic  
sediments

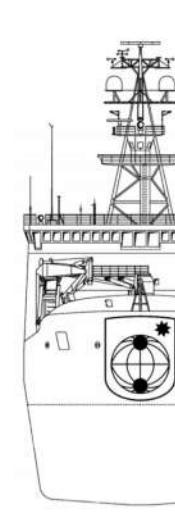

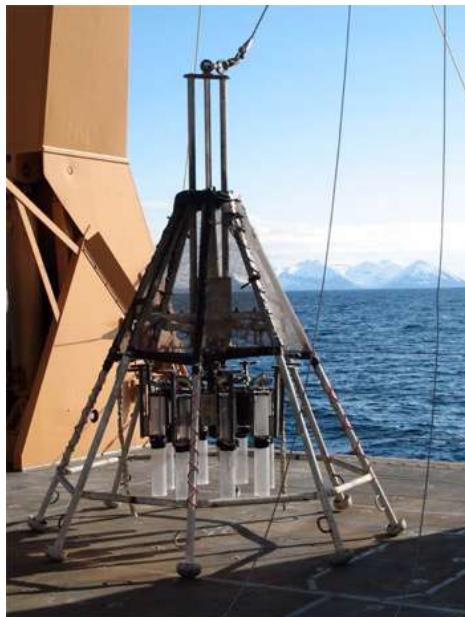

Box core sampling

# Additional gravity core systems: Multi-corer

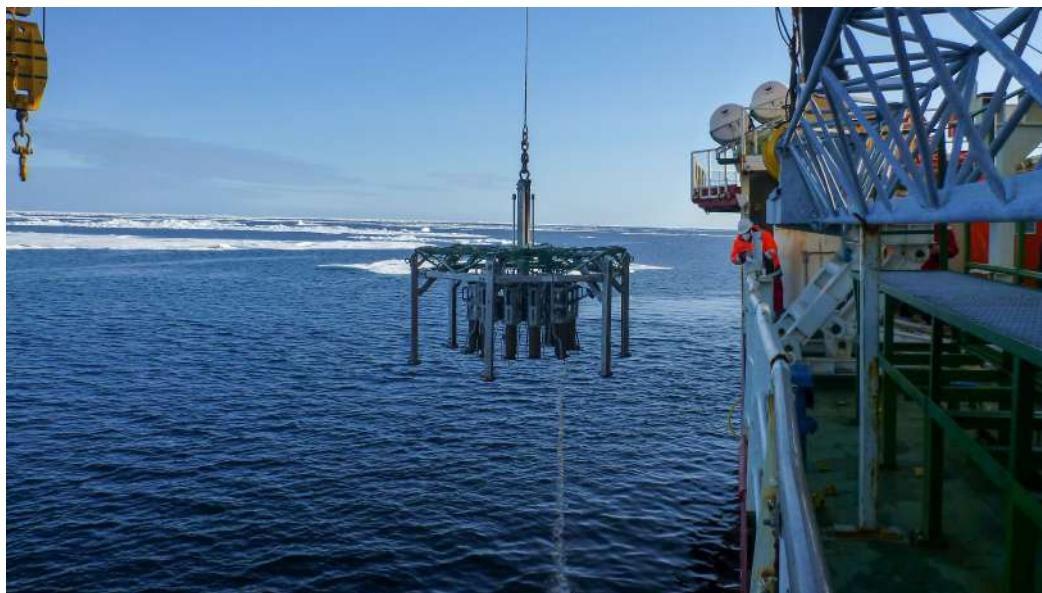

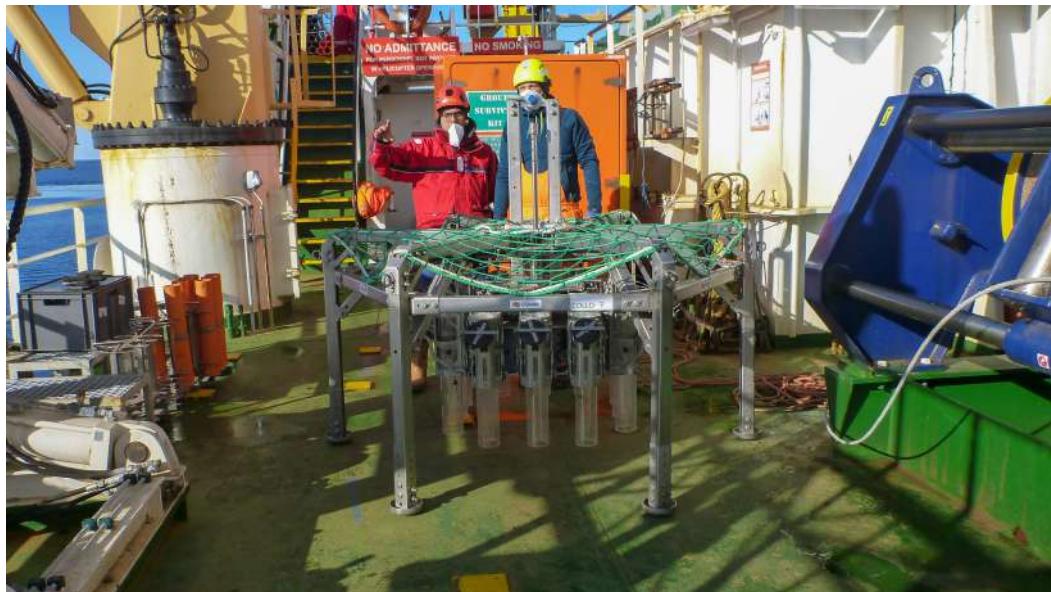

Especially designed for the sampling of sea bottom sediments-water interface, it permits to recover low disturbance sediment. Ideal for geochemical and biological sediment and water analysis.

## Kullenberg piston corer system

Standard assemblage for piston coring. The core barrel penetration is maximised by the action of a piston located in the lower barrel (or into the lower plastic liner if present) that helps to overcome the friction between sediments and the coring tube by generating Vacuum behind the cutter. The sediment cores obtained are less compacted and distorted than gravity cores. This system is always used coupled with a trigger mechanism.

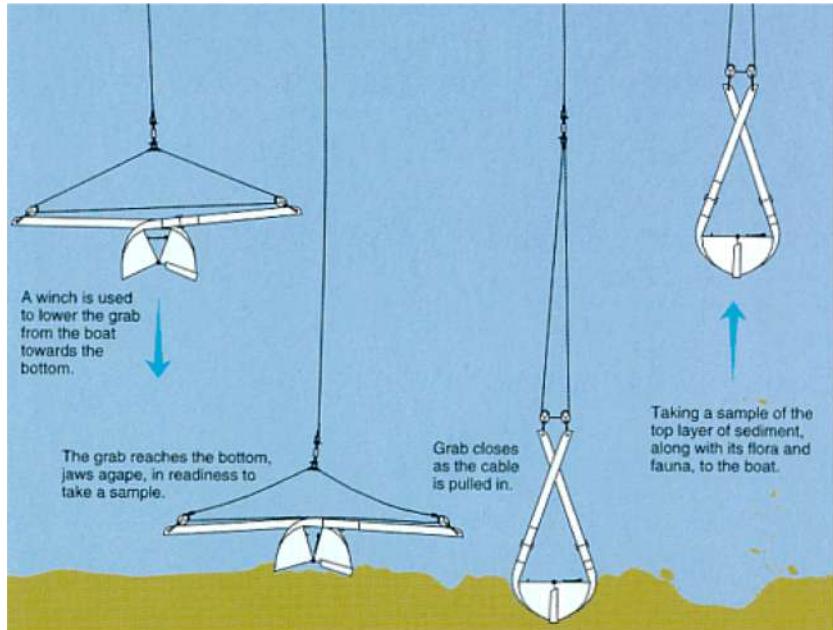

| Specifications               | Kullenberg piston corer | Long piston corer |
|------------------------------|-------------------------|-------------------|
| headweight                   | 600 kg                  | 6000 kg           |
| barrel length                | 6 m                     | 13 m              |
| barrel inner diameter        | 65 mm                   | 140 mm            |
| barrel thickness             | 5 mm                    | 5 mm              |
| plastic liner outer diameter | 63 mm                   | 113 mm            |
| plastic liner thickness      | 3 mm                    | 5 mm              |
| maximum cable length         | 5000 m                  | 10000 m           |
| cable diameter               | 12 mm                   | 30 mm             |
| freefall                     | 4-5 m                   | 1.5 m             |

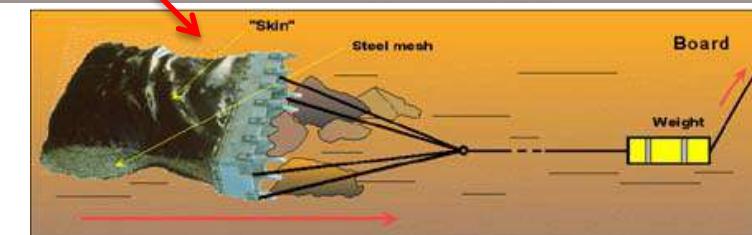

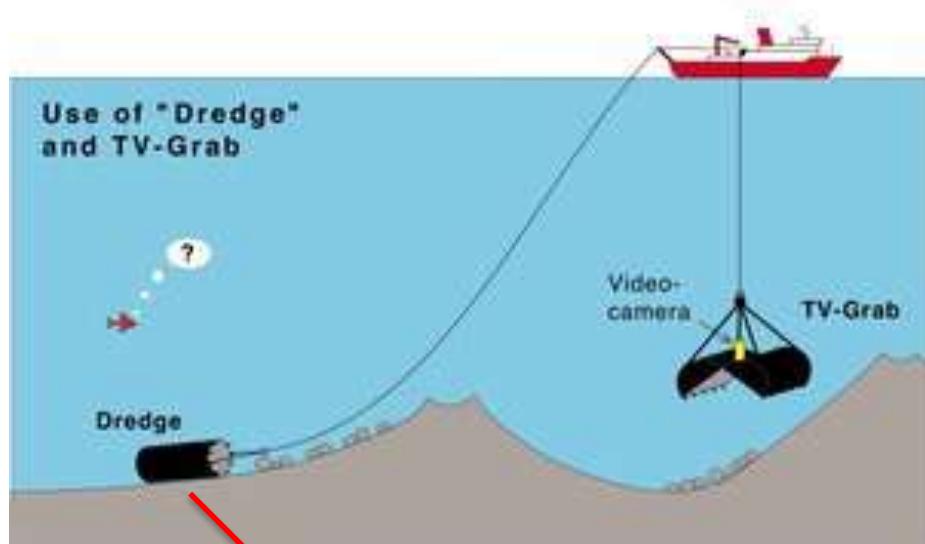

Long piston corers:  
Claypso, Jumbo etc.

# CORE ON DECK!

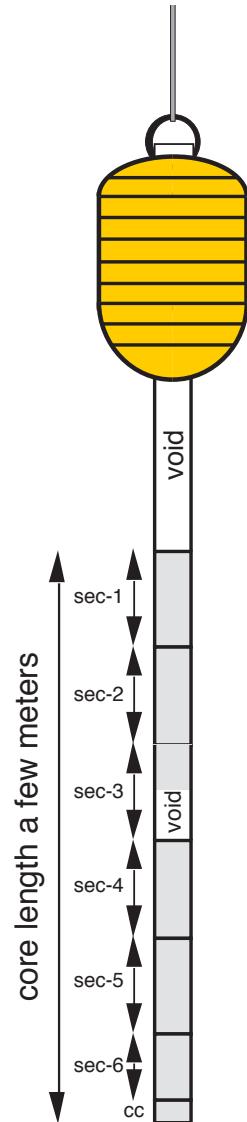

## CUT INTO SECTIONS

The plastic liner is extracted from the barrel and cut into sections 1-1.5 m-long

## SECTIONS' LABELING

The sections are numbered consecutively from bottom to top of the core or *vice versa* depending on the total length of the core.

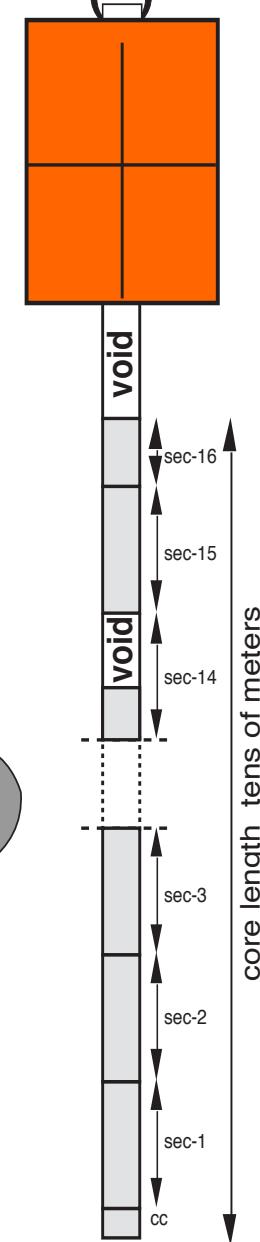

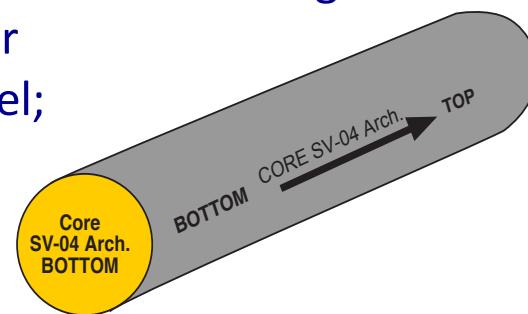

**Short cores** are numbered consecutively from top to bottom.

**Long cores** are numbered consecutively on removal from the barrel from bottom to top of core.

Each section is labeled with a code indicating

- » name of the project and/or
- » name of the research vessel;
- » core number;
- » section number
- » stratigraphic orientation (top-bottom, arrow)

!!!! The arrow ALWAYS indicates the TOP !!!!!

# CORE OPENING AND SEDIMENTS ANALYSIS

The plastic liner of each section is cut longitudinally. The plastic liner is cut by means of an electric saw/microvibro saw, while the sediments are cut using a “cheese wire”.

The two splitted half-sections are labeled as **working section** and **archive section** and will undergo a different analytical process:

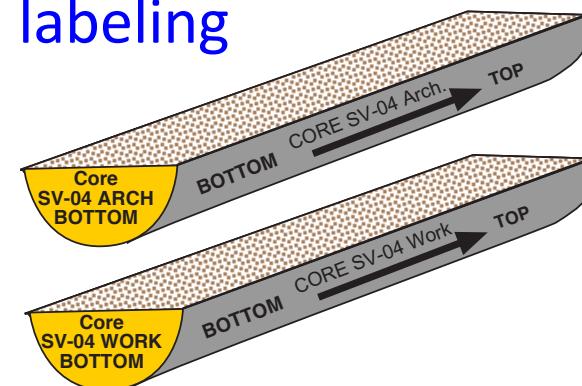

**ARCHIVE SECTIONS:** not destructive analyses

- X-radiographs
- multi-sensor core logger
- XRF core-scan
- photographs

**WORKING SECTIONS:** visual logging and sub-sampling

Half-sections'  
labeling

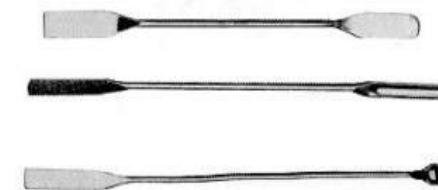

# CORE DESCRIPTION

# Visual core description 1st step

- ***Definition of lithological units*** based on:
  - Lithology including composition and texture
  - Color
  - Sedimentary structures (laminations, bioturbations, faults)
  - Boundaries (transitional, sharp not erosive, sharp erosive, irregular)
- ***Definition of sediment disturbance***
  - Soupy sediments
  - Bended boundaries at the lateral ends
  - Flow-in (piston cores)
  - Core re-bouncing (repetition of stratigraphic sections) in gravity cores

## sediment composition

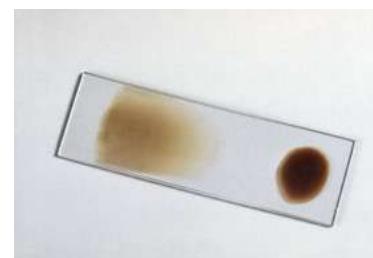

### Mud composition - Smear slides

(view <https://www.youtube.com/watch?v=2sDejrpwxD4&feature=youtu.be>)

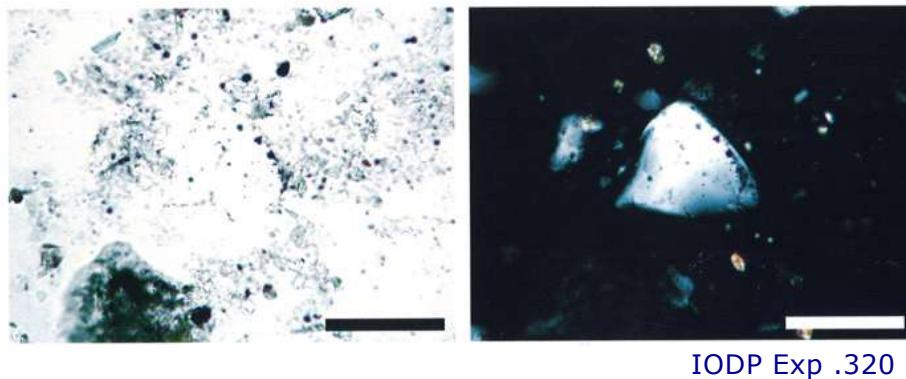

- A smear slide is a thin layer of unconsolidated sediment embedded on a glass slide for petrographic microscopic examination;
- Smear slides are a useful tool to quickly assess the ***compositional content*** of clay-silty sediment samples;
- Smear slides are a powerful method for rapidly evaluating tiny quantities of sediment (mineralogy, components, form, size) as the basis for ***sediment classification***, and for ascertaining the presence of microfossils.

## Sand composition

- wet sievings at 63 microns are used to investigate the composition of sediment coarse fraction, the grains form and roundness, in order to define the sediment provenance. The sand fraction is also used for biostratigraphic purposes.

**DESCRIPTION OF SMEAR SLIDES**

**Calcareous nannofossil:** list of the most characteristic taxa and their abundance  
(AA=very abundant; A=abundant; O=occurring; R=rare; RR=very rare)

|                     |                      |                        |                           |
|---------------------|----------------------|------------------------|---------------------------|
| <i>E. huxleyi</i>   | <i>G. oceanica</i>   | <i>G. caribbeanica</i> | <i>small Gephyrocapsa</i> |
| <i>H. carteri</i>   | <i>C. leptoporus</i> | <i>S. pulchra</i>      | <i>S. histrica</i>        |
| <i>C. pelagicus</i> | <i>S. recurvata</i>  | <i>P. scutellum</i>    | <i>O. antillarum</i>      |
| <i>R. clavigera</i> | <i>R. stylifer</i>   | <i>S. fossilis</i>     | <i>B. bigelowi</i>        |
| <i>U. tenuis</i>    | <i>C. jonesii</i>    | <i>T. saxeae</i>       | <i>C. rugosus</i>         |
| <i>C. cristatus</i> | <i>P. multipora</i>  | <i>P. lacunosa</i>     | <i>C. macintyreai</i>     |
| <i>D. broweri</i>   | <i>H. sellii</i>     | <i>Discoaster sp.</i>  |                           |
