

TEORIE DI GAUGE NON-ABELIANE

Prendiamo una teoria inv. sotto una trasf. globale
data da un gruppo di Lie G semplice (suon' semplice)

Prendiamo un campo $\varphi \rightarrow \varphi(x)$ è in una rapp. R ,
che trasf. sotto G cioè è un campo a valori

in V_R (sezione del fib.
con fibra $E_x \cong V_R$)

$$FS: G = SU(2) \quad R = \underline{2}$$

$$\varphi \in V_R \quad \varphi = \begin{pmatrix} \varphi_1 \\ \varphi_2 \end{pmatrix}$$

se φ è "uno scalare
nella rep. $\underline{2}$ " vuol
dire che φ_1 e φ_2
sono scalari!

(φ prende valori in
 $V_R \otimes V_{\text{Lorentz}}$)

Lagrangiana invariante (φ scalare)

$$L = \partial_\mu \varphi_1^* \partial^\mu \varphi_1 + \partial_\mu \varphi_2^* \partial^\mu \varphi_2 - m^2 |\varphi_1|^2 - m^2 |\varphi_2|^2$$

$$= \partial_\mu \varphi^+ \partial^\mu \varphi^- - m^2 \varphi^+ \varphi^- \quad \begin{matrix} \text{vale anche per} \\ \text{SU}(N) \end{matrix}$$

$$N \otimes \bar{N} = 1 \oplus \text{Adj}$$

↑ c'è singolarità

q.t. formule
rende L
invariante
sotto $U \in \text{SU}(2)$

Ora abbiamo

$$L(\varphi, \partial\varphi) \text{ invariante sotto } \varphi \mapsto U\varphi \quad (U \text{ matrice costante})$$

$$U \in G \quad U = e^{-i\alpha^a t_R^a}$$

$$\text{cioè } L(U\varphi, U\partial\varphi) = L(\varphi, \partial\varphi)$$

φ trasformata in rapp. R

Passiamo a trasf. locali (di gauge)

$$U \mapsto U(x) = e^{-i\alpha^a(x)t_a}$$

$\partial_\mu \Psi$ non trasforma più come $U \partial_\mu \Psi$

$$\partial_\mu \Psi \mapsto \partial_\mu (U\Psi) = \underline{(\partial_\mu U)\Psi + U \partial_\mu \Psi}$$

Introduciamo la DERIVATA COVARIANTE (vorremo che $D\Psi \mapsto U D\Psi$)

$$D_\mu \Psi = (\partial_\mu + i A_\mu) \Psi$$

↑
matrice

$$D_\mu v^S = \partial_\mu v^S + \Gamma_{\mu\nu}^S v^\nu$$

analog
in GR
mettere con indicati S

$$(D_\mu \Psi)_i = \partial_\mu \Psi_i + i (A_\mu)_i^j \Psi_j$$

A_μ è definita in modo tale che

$$D_\mu \Psi \mapsto U D_\mu \Psi$$

$$\begin{aligned} D_\mu \Psi &\mapsto (\partial_\mu + i A_\mu') \Psi' = (\partial_\mu + i A_\mu') U \Psi = \\ &= (\partial_\mu U) \Psi + \underline{U \partial_\mu \Psi} + i A_\mu' U \Psi \\ &\quad + \underline{i U A_\mu \Psi} - i U A_\mu' \Psi \\ &= \underline{U D_\mu \Psi} + (\partial_\mu U + i A_\mu' U - i U A_\mu) \Psi \end{aligned}$$

\Rightarrow ottieniamo $D_\mu \Psi \mapsto U D_\mu \Psi$ se

$$A_\mu' = U A_\mu \bar{U}^{-1} + i (\partial_\mu U) \bar{U}^{-1}$$

$$\begin{aligned} &[-i U \partial_\mu \bar{U}^{-1} \text{ perché } U \bar{U}^{-1} = 1] \\ &\Rightarrow \partial_\mu (U \bar{U}^{-1}) = 0 \end{aligned}$$

$\mathcal{L}(\varphi, D_\mu \varphi)$ è invariante sotto trasf. locali:

$$\begin{cases} \varphi' = U\varphi \\ A_\mu' = U A_\mu U^{-1} + i (\partial_\mu U) U^{-1} \end{cases}$$

$$L_{(X,Y)}^{\text{fischi}} = L(UX,UY)$$

Trasf. INFINITESIME $\leftrightarrow \alpha^\alpha(x) \ll 1$

* off. in rep. Adj
gl'inv. combinate lin.
di generatori dell'Alg
(in gl'inv. rep tranne)

$$U(x) = e^{-i \alpha^\alpha(x) t_R^\alpha} \approx 1 - i \alpha(x) t_R^\alpha = 1 - i \alpha(x)$$

oggetto nelle

RAPP. AGGIUNTA
(abuso di linguaggio)

$$\delta \varphi = -i \alpha(x) \varphi \quad (\delta \varphi \equiv \varphi' - \varphi)$$

$$\begin{aligned} \delta A_\mu &= A_\mu' - A_\mu = (1 - i \alpha) A_\mu (1 + i \alpha) + i (\partial_\mu (1 - i \alpha)) (1 + i \alpha) - A_\mu \\ &= A_\mu - i \alpha A_\mu + i A_\mu \alpha + \partial_\mu \alpha - A_\mu \\ &= \partial_\mu \alpha + i [A_\mu, \alpha] \quad \leftarrow D_\mu \alpha \quad (*) \\ &= \partial_\mu \alpha^\alpha t_R^\alpha - i \alpha^\alpha [\alpha^\alpha t_R^\alpha, A_\mu] \end{aligned}$$

$$\text{Se prendiamo } \alpha^\alpha \text{ cost. } \Rightarrow \delta A_\mu = -i [\alpha^\alpha t_R^\alpha, A_\mu]$$

$\Rightarrow A_\mu$ trasf. nelle rep. Adj

$$\rightarrow A_\mu = A_\mu^\alpha t_R^\alpha \quad (*)$$

La commutazione che appare in un vett. nelle rapp. R
è data da $(*)$

$$(\text{Se altrove } \varphi \in R \subset X \in \tilde{R} \quad D_\mu \varphi = \partial_\mu \varphi + i A_\mu^\alpha t_R^\alpha \varphi \quad D_\mu X = \partial_\mu X + i A_\mu^\alpha t_R^\alpha X)$$

$$\begin{aligned}
 \delta A_\mu &= \partial_\mu \alpha^a t_R^a - i \alpha^a A_\mu^b [t_R^a, t_R^b] = \\
 &= \partial_\mu \alpha^c t_R^c - i \alpha^a A_\mu^b f^{abc} t_R^c \\
 &= (\partial_\mu \alpha^c + f^{cab} \alpha^a A_\mu^b) t_R^c = \delta A_\mu^c t_R^c
 \end{aligned}$$

\Downarrow

$$\delta A_\mu^a = \partial_\mu \alpha^a - f^{abc} A_\mu^b \alpha^c$$

$$\begin{aligned}
 (A) \quad D_\mu \alpha &= \partial_\mu \alpha + i A_\mu^a t_A^a \alpha = \partial_\mu \alpha + i A_\mu^a [t^a, \alpha] = \\
 &\quad - \partial_\mu \alpha + i [A_\mu, \alpha]
 \end{aligned}$$

TERMINE CINETICO per i bosoni di gauge $A_\mu^a(x)$

↑ INV. sotto Lorentz, gauge e quadratico nelle derivate.

Finora introdotto campo nuovo, ma subito salterà termini intere.

$$\left[\text{In QED avevamo } -\frac{1}{4} F_{\mu\nu} F^{\mu\nu} \quad F_{\mu\nu} = \partial_\mu A_\nu - \partial_\nu A_\mu \right)$$

Pertanto calcoleremo $[D_\mu, D_\nu]$

$$\begin{aligned}
 &[(\partial_\mu + i A_\mu), (\partial_\nu + i A_\nu)] \varphi = \\
 &= [\partial_\mu, \partial_\nu] \varphi + i [\partial_\mu, A_\nu] \varphi - i [\partial_\nu, A_\mu] \varphi \\
 &\stackrel{=0}{=} - [A_\mu, A_\nu] \varphi \\
 &\quad \underbrace{\neq 0}_{\text{in teorie di gauge non-abs}}
 \end{aligned}$$

$$\begin{aligned}
 &= i \partial_\mu (A_\nu \varphi) - i A_\nu \partial_\mu \varphi - (\mu \leftrightarrow \nu) \\
 &\quad - [A_\mu, A_\nu] \varphi
 \end{aligned}$$

$$\begin{aligned}
&= i(\partial_\mu A_\nu) \varphi + iA_\nu \cancel{\partial_\mu} \varphi - i\cancel{A_\nu} \partial_\mu \varphi - (\mu \leftrightarrow \nu) \\
&\quad - [A_{\mu\nu}, A_\nu] \varphi \\
&= i \left[\partial_\mu A_\nu - \partial_\nu A_\mu + i[A_\mu, A_\nu] \right] \varphi \\
&\equiv i F_{\mu\nu} \varphi \qquad \qquad F_{\mu\nu} = -i[D_\mu, D_\nu]
\end{aligned}$$

Vediamo come trasformare $F_{\mu\nu}$

$$\begin{aligned}
F_{\mu\nu} \varphi = [D_\mu, D_\nu] \varphi &\mapsto U [D_\mu, D_\nu] \varphi = U F_{\mu\nu} \varphi = \\
&= U F_{\mu\nu} U^{-1} (U \varphi) \\
\downarrow &\mapsto \bar{F}_{\mu\nu}^1 \varphi^1 = \bar{F}_{\mu\nu}^1 (U \varphi)
\end{aligned}$$

$$\bar{F}_{\mu\nu}^1 = U \bar{F}_{\mu\nu} U^{-1}$$

poniamo espandendo

trasforma in matrice
covariante (come un off.
nella rep. Adj) con $U(x)$.

$$F_{\mu\nu} = F_{\mu\nu}^\alpha t_R^\alpha \quad \leftarrow \text{CURVATURA (dalle connessioni } A_\mu^\alpha \text{)}$$

$$\begin{aligned}
F_{\mu\nu} &= \partial_\mu A_\nu - \partial_\nu A_\mu + i[A_\mu, A_\nu] = \partial_\mu A_\nu^\alpha t_R^\alpha - \partial_\nu A_\mu^\alpha t_R^\alpha + \\
&\quad + i A_\mu^b A_\nu^c [t_R^b, t_R^c] = \\
&= (\partial_\mu A_\nu^\alpha - \partial_\nu A_\mu^\alpha - f^{abc} A_\mu^b A_\nu^c) t_R^\alpha
\end{aligned}$$

$$\Rightarrow F_{\mu\nu}^\alpha = \partial_\mu A_\nu^\alpha - \partial_\nu A_\mu^\alpha - f^{abc} A_\mu^b A_\nu^c$$

Il termine cinetico dev'essere Lorentz inv. e gauge inv.

$$= -k \operatorname{tr} (\bar{F}_{\mu\nu} F^{\mu\nu}) \quad \operatorname{tr}(FF) \mapsto \operatorname{tr}(U\bar{F}U^\dagger U\bar{F}U^\dagger) = \\ = \operatorname{tr}(FF)$$

\nearrow
c'è doppia traccia

$$= -k F_{\mu\nu}^a F^{b\mu\nu} \operatorname{tr}(t_R^a t_R^b) =$$

$$= -k F_{\mu\nu}^a F^{b\mu\nu} C(R) \delta^{ab} = -k C(R) F_{\mu\nu}^a F^{a\mu\nu}$$

$$\rightarrow = -\frac{1}{4} F_{\mu\nu}^a F^{a\mu\nu} \quad \Leftarrow k = \frac{1}{4C(R)}$$

termine
cinetico normativi
convenien.

$$\downarrow \\ G = SU(N) \quad e \quad R = N \quad C(N) = 1/2$$

$$\rightarrow k = \frac{1}{2}$$

[Se G non è compatto, allora $\operatorname{tr}(t_R^a t_R^b) \neq \delta^{ab}$,
ma sulla diagonale ci sono $+1$ e -1
 \Rightarrow avremo dei termini che mettono negativi.]

$-\frac{1}{4} F_{\mu\nu}^a F^{a\mu\nu}$ contiene termini COBICI e QUARTICI in A_μ^a
 \rightarrow termini di interazione tra i bosoni vettori

la legge generale $\mathcal{L}(\varphi, A)$ inv. sotto trasf. gauge

$$\mathcal{L}(\varphi, A) = \underbrace{\mathcal{L}(\varphi, D_\mu \varphi)}_{\text{before}} - \frac{1}{4g^2} F_{\mu\nu}^a F^{a\mu\nu}$$

Per i calcoli perturbativi si ha che può essere

$$A_\mu^a \mapsto g A_\mu^a \quad (\text{riduz. di coupl.})$$

$$F_{\mu\nu}^a \mapsto g \partial_\mu A_\nu^a - g \partial_\nu A_\mu^a - g^2 f^{abc} A_\mu^b A_\nu^c$$

$$= g F_{\mu\nu}^a$$

g^2 sparisce dal termine ch.

$$F_{\mu\nu}^a = \partial_\mu A_\nu^a - \partial_\nu A_\mu^a - g f^{abc} A_\mu^b A_\nu^c$$

$$D_\mu \psi \mapsto (\partial_\mu + ig A_\mu) \psi$$

$$\mathcal{L} = \mathcal{L}_{\text{before}}(\psi, D_\mu \psi) - \frac{1}{4} F_{\mu\nu}^a F^{a\mu\nu}$$

g è la COSTANTE DI ACCOPPIAMENTO

REGOLE DI REYNARD (massless)

Scegliere ψ spinore e lo chiamare ψ

$$\mathcal{L}_{\text{before}}(\psi, D_\mu \psi) = i \bar{\psi} \gamma^\mu D_\mu \psi = \frac{i}{\beta} \bar{\psi} \not{\partial} \psi$$

$$= i \bar{\psi} \gamma^\mu \partial_\mu \psi - g \bar{\psi} \gamma^\mu A_\mu \psi$$

$$-g \bar{\psi} \gamma^\mu A_\mu^a t_R^a \psi = -g \bar{\psi}_{i_\alpha} \gamma^\mu (t_R^a)_{ij} \psi_{j_\beta} A_\mu^a$$

$i\beta$

$i\alpha$

$-ig \gamma^\mu (t_R^a)_{ij}$

$$\begin{aligned} \mathcal{L}_{\text{kin}}(A) &= -\frac{1}{4} F_{\mu\nu}^a F^{a\mu\nu} = -\frac{1}{4} (\partial_\mu A_\nu^a - \partial_\nu A_\mu^a - g f^{abc} A_\mu^b A_\nu^c) \\ &\quad \cdot (\partial^\mu A^{av} - \partial^\nu A^{av} - g f^{ade} A^{du} A^{ev}) \\ &= -\frac{1}{4} (\partial_\mu A_\nu^a - \partial_\nu A_\mu^a)^2 + \frac{1}{2} g f^{abc} A_\mu^b A_\nu^c (\underbrace{\partial^\mu A^{av} - \partial^\nu A^{av}}_{2\partial^\mu A^{av}}) \\ &\quad - \frac{1}{4} g^2 f^{abc} f^{ade} A_\mu^b A_\nu^c A_\mu^d A_\nu^e \end{aligned}$$
