

(a)

(b)

Formazione di un orbitale d_{z^2} da una combinazione lineare di $d_{z^2-y^2}$ e $d_{z^2-x^2}$

Teoria del Campo Cristallino

Metal ion M^{n+} and six ligands L at an infinite distance away

If the electrostatic field created by the point charge ligands is *spherical*, the energies of the electrons in the $3d$ orbitals are raised uniformly

If the electrostatic field created by the point charge ligands is *octahedral*, the energy of the electrons in the $3d$ orbitals that point *directly* at the ligands is raised with respect to that in the spherical field, while the energy of the electrons in the orbitals that point *between* the ligands is lowered with respect to the spherical field

d^{10}		

Un'inversione nell'andamento $Kf_n > Kf_{n+1}$ è normalmente un'indicazione di una grande variazione nella struttura elettronica del complesso

Transizione alto-spin – basso-spin, aumento LFSE

Andamento dei raggi degli ioni M^{2+} dei metalli 3d in complessi ottaedrici

La linea tratteggiata indica i valori attesi tenendo conto soltanto dell'aumento di carica nucleare effettiva

Splitting degli orbitali d in campo tetraedrico

	E	$8C_3$	$3C_2$	$6S_4$	$6\sigma_d$	linear, rotations	quadratic
A_1	1	1	1	1	1		$x^2+y^2+z^2$
A_2	1	1	1	-1	-1		
E	2	-1	2	0	0		$(2z^2-x^2-y^2, x^2-y^2)$
T_1	3	0	-1	1	-1	(R_x, R_y, R_z)	
T_2	3	0	-1	-1	1	(x, y, z)	(xy, xz, yz)

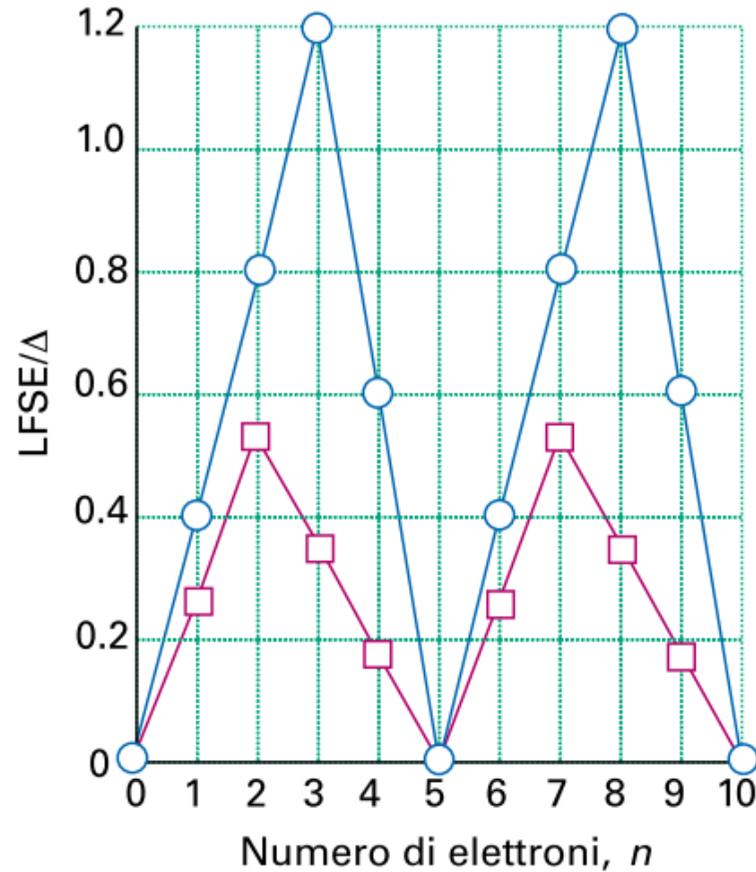

Campo ottaedrico

Campo tetraedrico

I complessi tetraedrici sono sempre ad alto spin

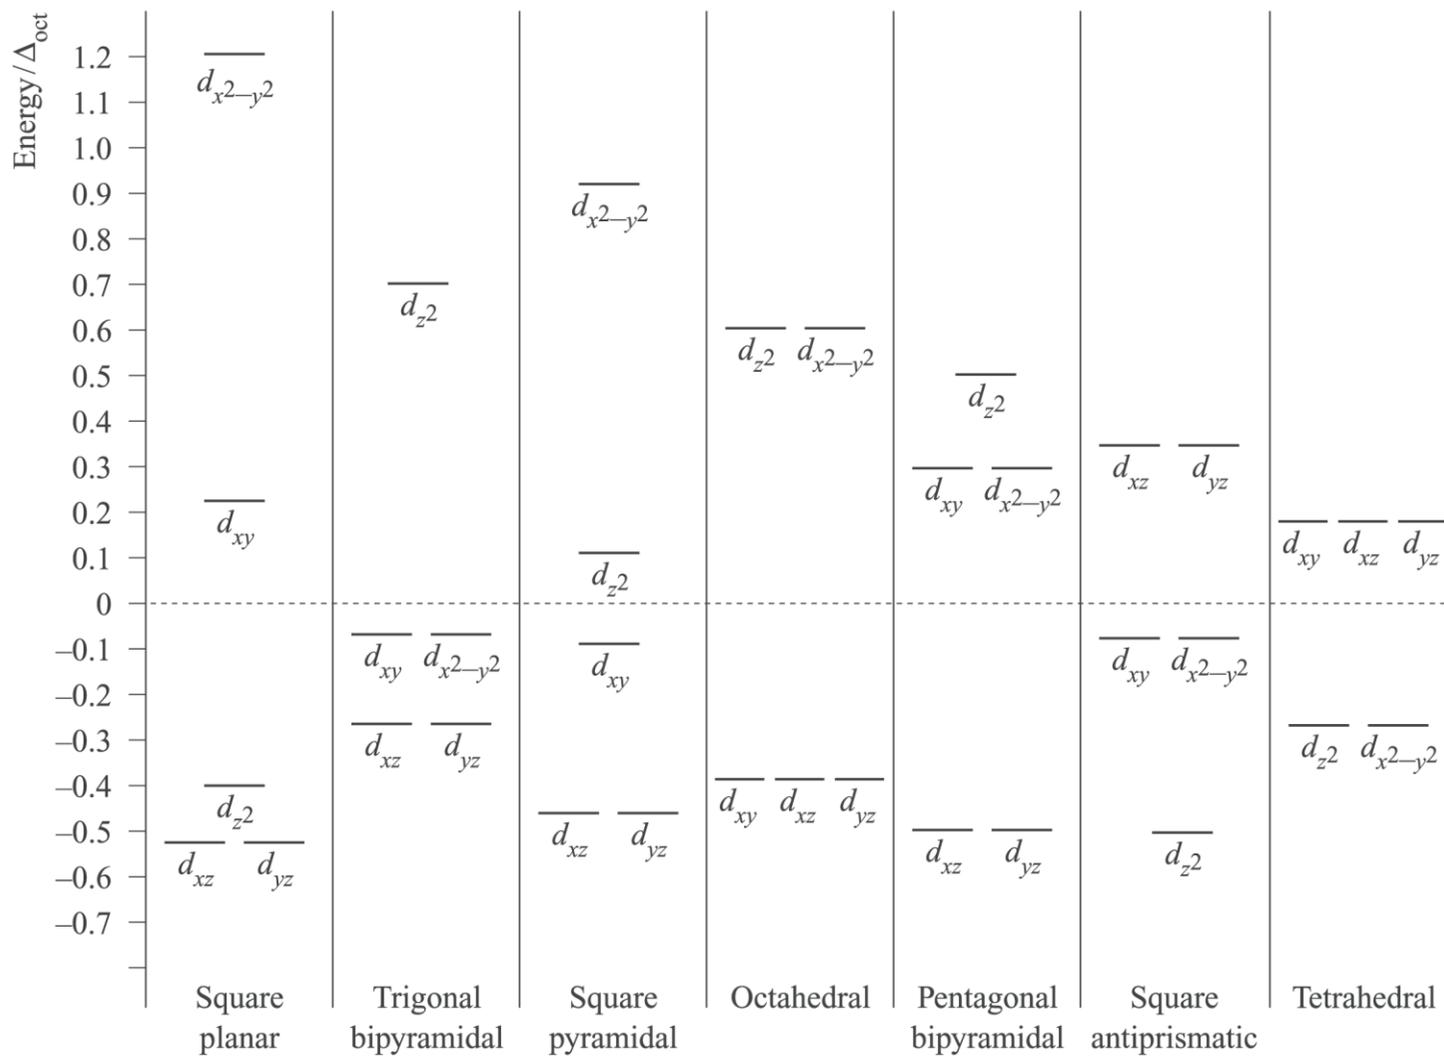

LFSE per complessi ottaedrici (alto spin) e tetraedrici

Splitting degli orbitali d in campo planare quadrato

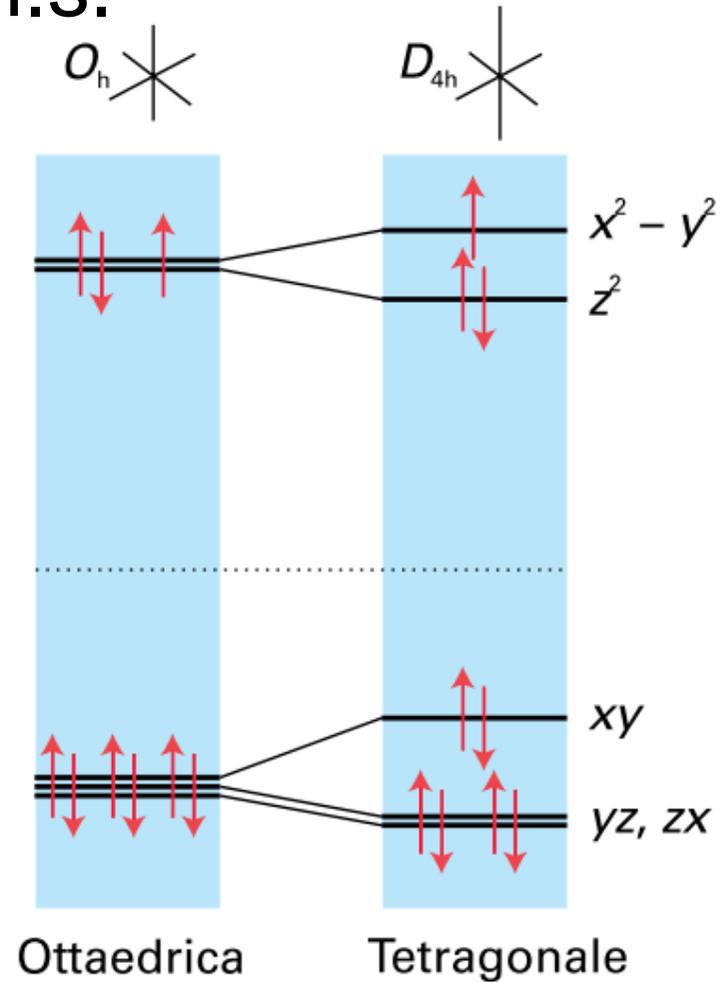

I complessi planari quadrati sono particolarmente comuni per gli ioni con configurazione elettronica d^8 : Ni(II), Pd(II), Pt(II), Rh(I), Ir(I), Au(III)

Effetto Jahn – Teller

d^9 , d^4 h.s.

Teorema di Jahn-Teller

(da Hermann A. Jahn ed Edward Teller)

*ogni sistema molecolare **non lineare** che abbia uno **stato elettronico degenere** è instabile e subirà distorsioni per generare un sistema a più bassa simmetria e più bassa energia, rimuovendo in questo modo la degenerazione.*

Effetto Jahn – Teller nello stato eccitato

Spettro di assorbimento elettronico del complesso d^1 $[\text{Ti}(\text{OH}_2)_6]^{3+}$

Fattori che influenzano la grandezza dello splitting (Δ)

Natura e stato di ossidazione del metallo

Serie spettrochimica dei leganti

Campo debole

Campo forte

Effetto nefelauxetico

l'energia di accoppiamento di elettroni, P , è inferiore nei complessi che nei corrispondenti ioni in fase gassosa

Metal ion	k	Ligands	h
Co(III)	0.35	6 Br ⁻	2.3
Rh(III)	0.28	6 Cl ⁻	2.0
Co(II)	0.24	6 [CN] ⁻	2.0
Fe(III)	0.24	3 en	1.5
Cr(III)	0.21	6 NH ₃	1.4
Ni(II)	0.12	6 H ₂ O	1.0
Mn(II)	0.07	6 F ⁻	0.8

$$\text{Effetto nefelauxetico} = k \times h$$

è necessario sviluppare una teoria che descriva i legami di coordinazione anche in termini covalenti e non solo elettrostatici
