

# Statistical Thermodynamics

Emanuele Coccia

Dipartimento di Scienze Chimiche e Farmaceutiche

- ecoccia@units.it
- C11 building, fourth floor, room 453/454
- Wednesday 15h-17h (or whenever you want, just send an email)
- Register on Moodle

# Programme

- Definition of statistical mechanics and concepts of thermodynamics

# Programme

- Definition of statistical mechanics and concepts of thermodynamics
- Boltzmann distribution

# Programme

- Definition of statistical mechanics and concepts of thermodynamics
- Boltzmann distribution
- Partition function: canonical ( $Z$ ), microcanonical, grandcanonical

# Programme

- Definition of statistical mechanics and concepts of thermodynamics
- Boltzmann distribution
- Partition function: canonical ( $Z$ ), microcanonical, grandcanonical
- Boltzmann statistics, ideal gas

# Programme

- Definition of statistical mechanics and concepts of thermodynamics
- Boltzmann distribution
- Partition function: canonical ( $Z$ ), microcanonical, grandcanonical
- Boltzmann statistics, ideal gas
- Translational, vibrational, rotational and electronic  $Z$

# Programme

- Definition of statistical mechanics and concepts of thermodynamics
- Boltzmann distribution
- Partition function: canonical ( $Z$ ), microcanonical, grandcanonical
- Boltzmann statistics, ideal gas
- Translational, vibrational, rotational and electronic  $Z$
- Energy equipartition law

# Programme

- Definition of statistical mechanics and concepts of thermodynamics
- Boltzmann distribution
- Partition function: canonical ( $Z$ ), microcanonical, grandcanonical
- Boltzmann statistics, ideal gas
- Translational, vibrational, rotational and electronic  $Z$
- Energy equipartition law
- Chemical equilibrium

# Programme

- Definition of statistical mechanics and concepts of thermodynamics
- Boltzmann distribution
- Partition function: canonical ( $Z$ ), microcanonical, grandcanonical
- Boltzmann statistics, ideal gas
- Translational, vibrational, rotational and electronic  $Z$
- Energy equipartition law
- Chemical equilibrium
- Vibrations in solids: Einstein and Debye models

# Programme

- Definition of statistical mechanics and concepts of thermodynamics
- Boltzmann distribution
- Partition function: canonical ( $Z$ ), microcanonical, grandcanonical
- Boltzmann statistics, ideal gas
- Translational, vibrational, rotational and electronic  $Z$
- Energy equipartition law
- Chemical equilibrium
- Vibrations in solids: Einstein and Debye models
- Third law of thermodynamics

# Programme

- Definition of statistical mechanics and concepts of thermodynamics
- Boltzmann distribution
- Partition function: canonical ( $Z$ ), microcanonical, grandcanonical
- Boltzmann statistics, ideal gas
- Translational, vibrational, rotational and electronic  $Z$
- Energy equipartition law
- Chemical equilibrium
- Vibrations in solids: Einstein and Debye models
- Third law of thermodynamics
- Real gas: virial coefficients, corrections for non-ideality

# Programme

- Definition of statistical mechanics and concepts of thermodynamics
- Boltzmann distribution
- Partition function: canonical ( $Z$ ), microcanonical, grandcanonical
- Boltzmann statistics, ideal gas
- Translational, vibrational, rotational and electronic  $Z$
- Energy equipartition law
- Chemical equilibrium
- Vibrations in solids: Einstein and Debye models
- Third law of thermodynamics
- Real gas: virial coefficients, corrections for non-ideality
- Liquids

# Programme

- Definition of statistical mechanics and concepts of thermodynamics
- Boltzmann distribution
- Partition function: canonical ( $Z$ ), microcanonical, grandcanonical
- Boltzmann statistics, ideal gas
- Translational, vibrational, rotational and electronic  $Z$
- Energy equipartition law
- Chemical equilibrium
- Vibrations in solids: Einstein and Debye models
- Third law of thermodynamics
- Real gas: virial coefficients, corrections for non-ideality
- Liquids
- Quantum ideal gas: Fermi-Dirac and Bose-Einstein statistics

# Programme

- Definition of statistical mechanics and concepts of thermodynamics
- Boltzmann distribution
- Partition function: canonical ( $Z$ ), microcanonical, grandcanonical
- Boltzmann statistics, ideal gas
- Translational, vibrational, rotational and electronic  $Z$
- Energy equipartition law
- Chemical equilibrium
- Vibrations in solids: Einstein and Debye models
- Third law of thermodynamics
- Real gas: virial coefficients, corrections for non-ideality
- Liquids
- Quantum ideal gas: Fermi-Dirac and Bose-Einstein statistics
- (Computational methods: molecular dynamics, Monte Carlo)

# Where studying

- Lesson notes
- *Statistical mechanics: A concise introduction for chemists*,  
Benjamin Widom, Cambridge
- Notes on Moodle
- Further reading: *An Introduction to Statistical Thermodynamics*, Terrell L. Hill, Dover Publications

- Oral exam: (at least) three questions, possible simple numerical problems to solve
- Exam done in a lecture room (two rounds in winter session, two rounds in summer session, one round in September)
