

Introduzione ai MICROFOSSILI

MICROPALÉONTOLOGIA

La micropaleontologia si occupa dello studio dei microfossili.

Tale studio viene condotto per mezzo di un microscopio

Quali sono gli organismi
di cui si occupa la
micropaleontologia??

coccolitoforidi

**ORGANISMI DI
PICCOLE DIMENSIONI**

acritarchi

diatomee

chitinozoi

dinocisti

foraminiferi

ostracodi

radiolari

PARTI PICCOLE DI
ORGANISMI PIU' GRANDI

Denti e scaglie
di pesce

Conodonti

COLONIE PIU' O MENO GRANDI,
FORMATE DA ORGANISMI PICCOLI

Graptoliti

Briozoi

TECNICHE DI PREPARAZIONE

Tecniche di preparazione

I microfossili sono contenuti in rocce o sedimenti. Per poterli studiare è necessario estrarli con tecniche diverse secondo la loro composizione e quella delle rocce ospitanti.

Si possono distinguere:

METODI MECCANICI (Polverizzazione)

Rocce sciolte o non troppo coerenti

METODI CHIMICI (es. Soda, Acqua Ossigenata)

- Microfossili calcarei

ATTACCHI ACIDI

- Microfossili non calcarei

SETACCIATURA

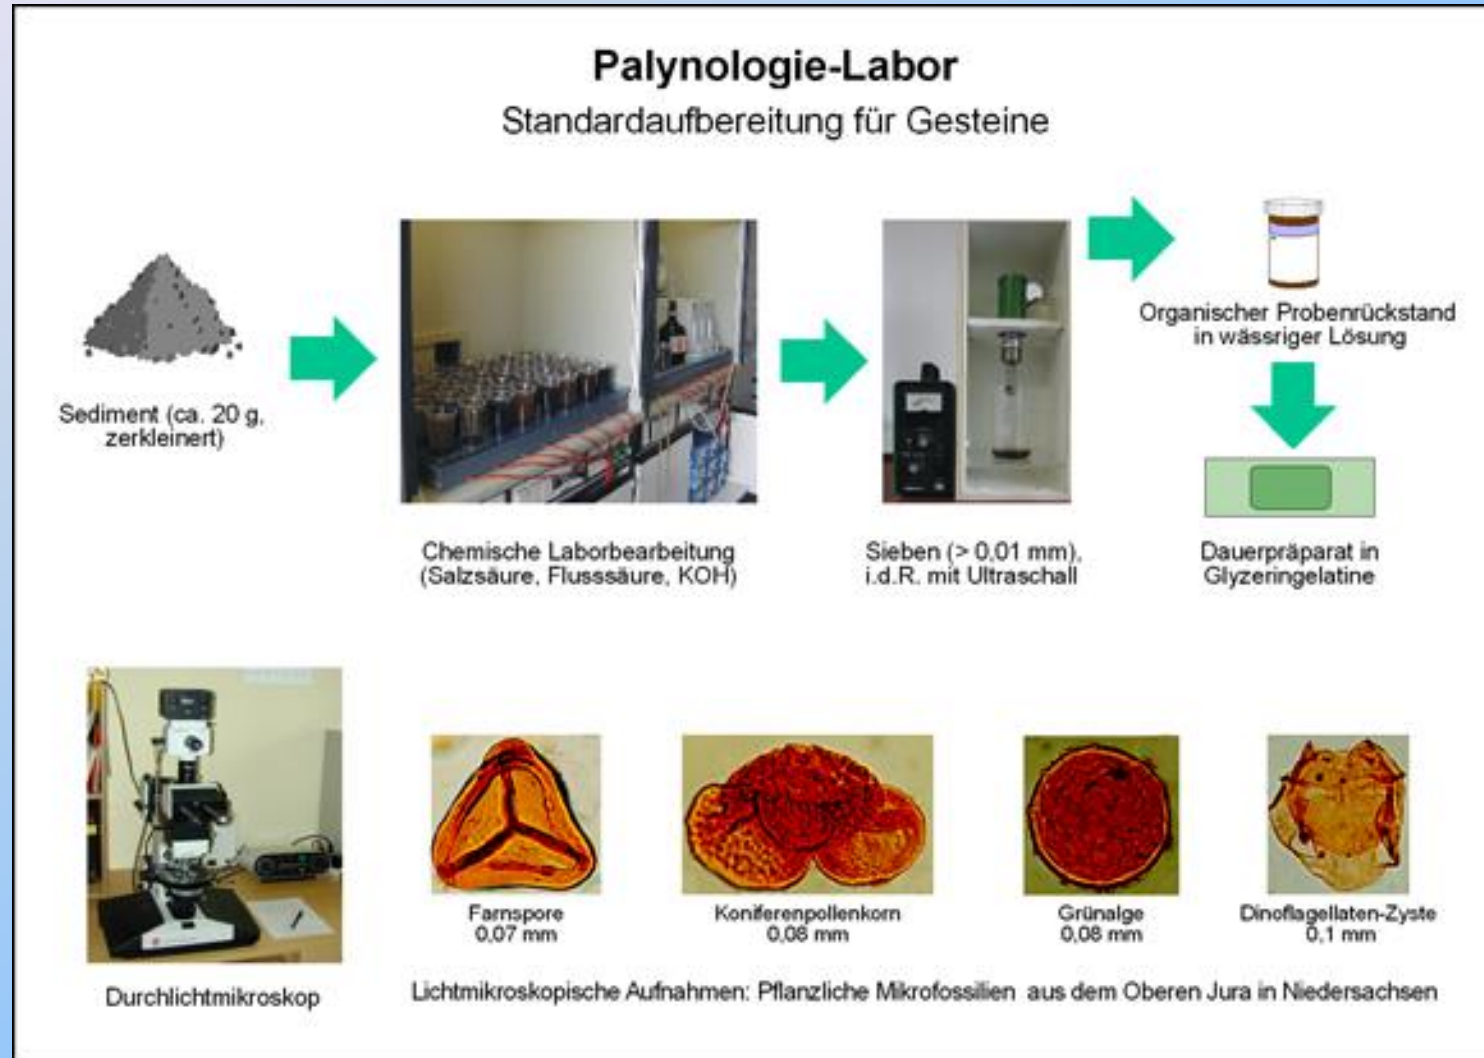

Preparazioni per microfossili calcarei

METODI CHIMICI

Preparazioni per palinologia

ATTACCO ACIDO

Preparazioni per microfossili non calcarei

ATTACCO ACIDO
