

Lesson 1

Water, pH and buffers

H₂O fundamentals

- The fundamental molecule of life
- 60-95% of living human cells is H₂O
 - 55% in intracellular fluids
 - 45% divided between:
 - Plasma (8%)
 - Interstitial (between cells) and lymph (22%)
 - Connective tissue, cartilage and bones (15%)

*Lymph (from Latin, *lymph*) is the fluid that flows through the lymphatic system, a system composed of lymph vessels (channels) and intervening lymph nodes whose function, like the venous system, is to return fluid from the tissues to the central circulation*

H₂O fundamentals

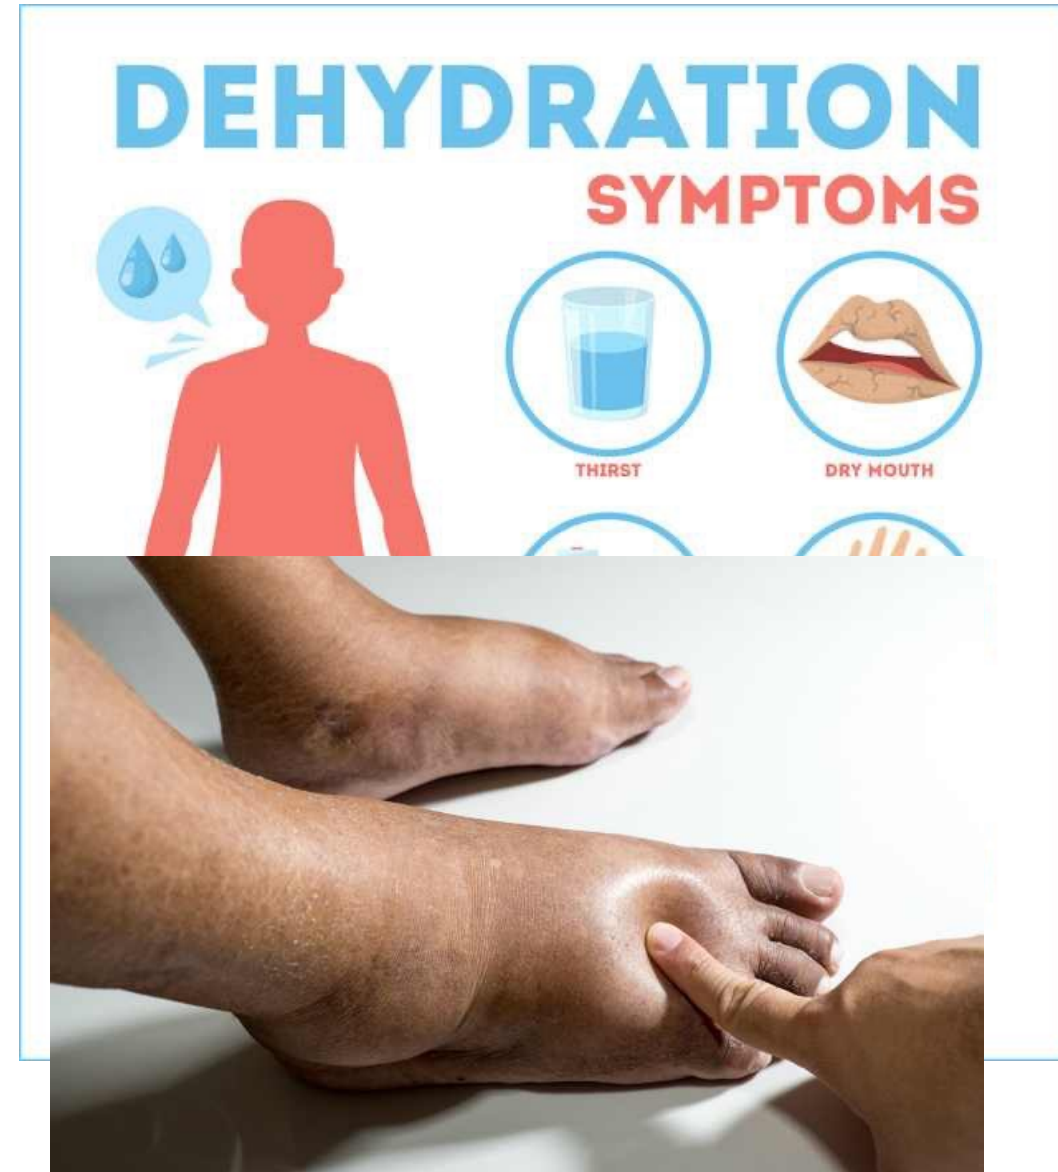

- In biochemistry:
 - Transport medium across cell membranes
 - Body temperature maintenance
 - Solvent in the GI and excretion system

H₂O fundamentals

- In biochemistry:
 - Transport medium across cell membranes
 - Body temperature maintenance
 - Solvent in the GI and excretion system
- **Healthy humans**
 - **Daily water intake/loss = 2L**
 - Intake --> 45% from liquids, 40% from food and 15% chemical reactions
 - Loss → 50% urines, 5% feces and 55% evaporation from lung and skin

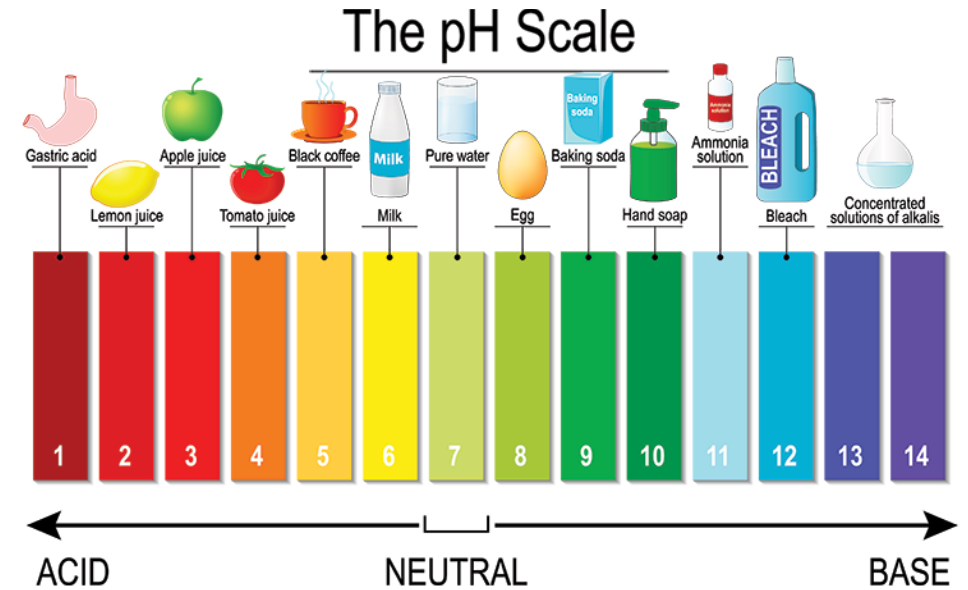

H₂O fundamentals

- In biochemistry:
 - Transport medium across cell membranes
 - Body temperature maintenance
 - Solvent in the GI and excretion system
- Healthy humans
 - Daily water intake/loss = 2L
 - Intake --> 45% from liquids, 40% from food and 15% chemical reactions
 - Loss --> 50% urines, 5% feces and 55% evaporation from lung and skin
- Water balance must be preserved:
 - Loss >> intake --> dehydration
 - Intake >> loss --> edema

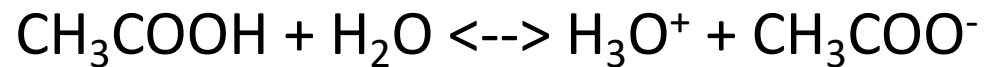

Water dissociation and pH

- $\text{H}_2\text{O} \rightleftharpoons \text{H}_3\text{O}^+ + \text{OH}^-$
 - $[\text{H}_3\text{O}^+] = [\text{OH}^-] \rightarrow$ neutral
 - $[\text{H}_3\text{O}^+] > [\text{OH}^-] \rightarrow$ acidic
 - $[\text{H}_3\text{O}^+] < [\text{OH}^-] \rightarrow$ basic
- $K_w = [\text{H}_3\text{O}^+] \times [\text{OH}^-] = 10^{-14}$ (25°C)
 - In human body @ 37°C $\rightarrow K_w = 2.4 \times 10^{-14}$
- In **pure water** $\rightarrow [\text{H}_3\text{O}^+] = [\text{OH}^-] = 10^{-7}$ (25°C)
 - $\text{pH} = -\log[\text{H}_3\text{O}^+] \rightarrow$ in pure water $\text{pH} = 7$
 - In human blood @ 37°C $\rightarrow \text{pH} = 7.4 \rightarrow [\text{H}_3\text{O}^+] = 3.98 \times 10^{-8}$
- $\text{p}K_w = 14$

Weak acids and bases

- In biology we have only weak acids and bases (incomplete dissociation)

$$K_a = [\text{H}_3\text{O}^+][\text{CH}_3\text{COO}^-]/[\text{CH}_3\text{COOH}]$$

$$K_b = [\text{NH}_4^+][\text{OH}^-]/[\text{NH}_3]$$

$$\text{p}K_a = -\log K_a$$

$$\text{p}K_b = -\log K_b$$

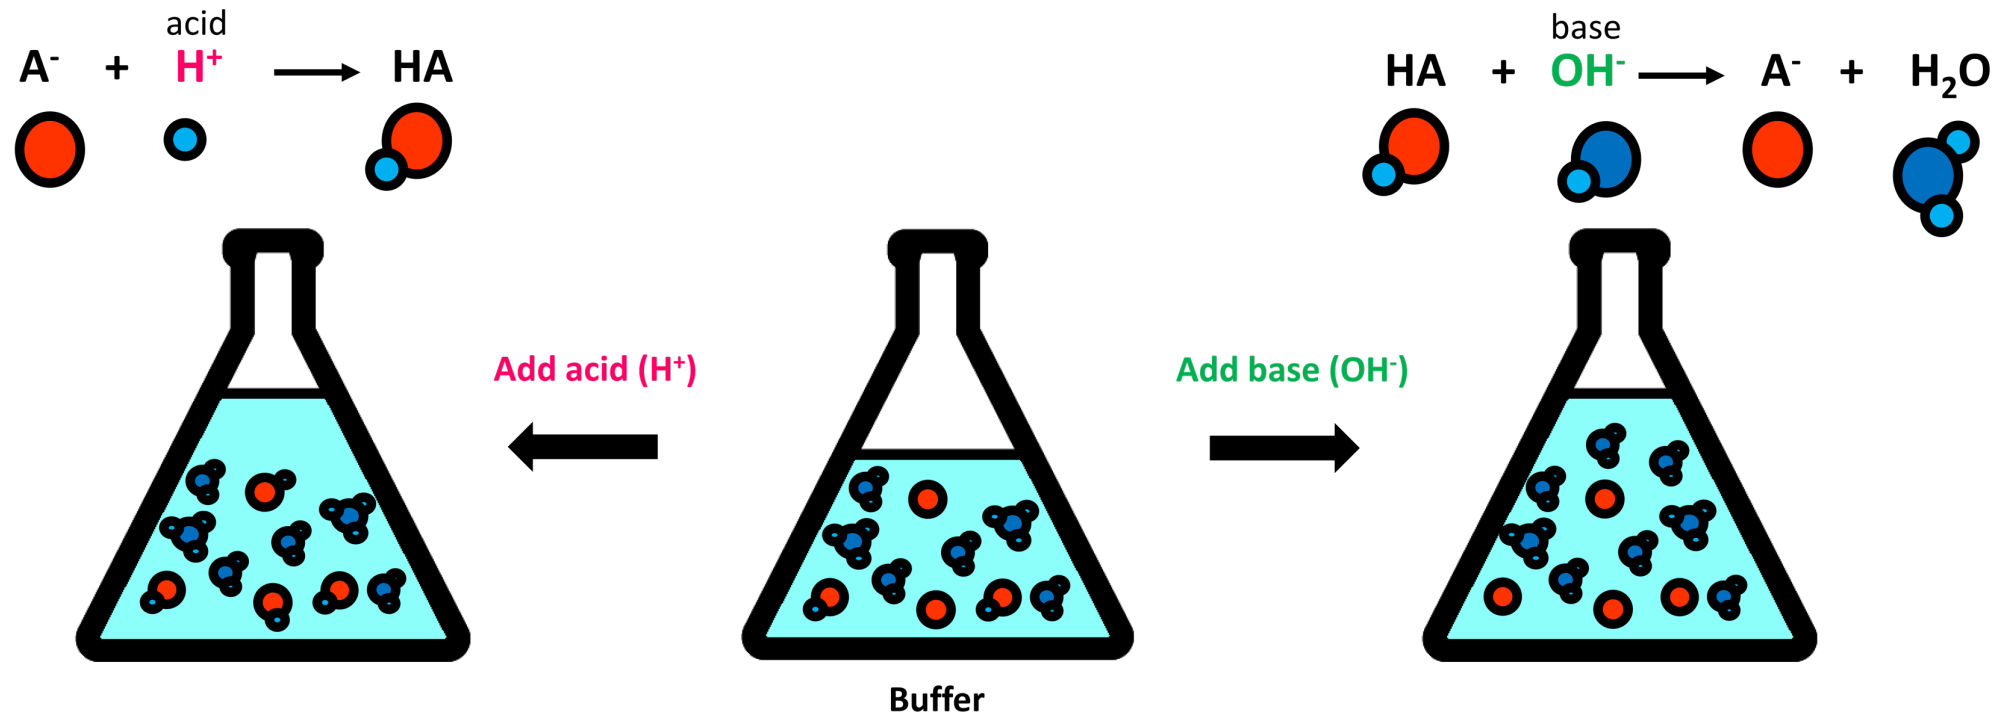

$$K_a \times K_b = K_w = 10^{-14} \rightarrow \text{p}K_a + \text{p}K_b = 14$$

CH_3COO^- conjugate base

NH_4^+ conjugate acid

Buffers and pH control

- A solution that contains a conjugate acid-base pair of any weak acid or base in relative proportions to resist pH change when small amounts of either a (strong) acid or base are added is a **buffer solution**

Identifying common physiological buffers

- Stomach pH = 1-2
- GI tract pH = 8-9
- Blood pH = 7.4
 - Blood pH < 7.2 --> pathological condition = acidosis
 - Blood PH < 6.8 --> death
 - Blood pH > 7.6 --> pathological condition = alkalosis
 - Blood pH > 8.6 --> death

Identifying common physiological buffers

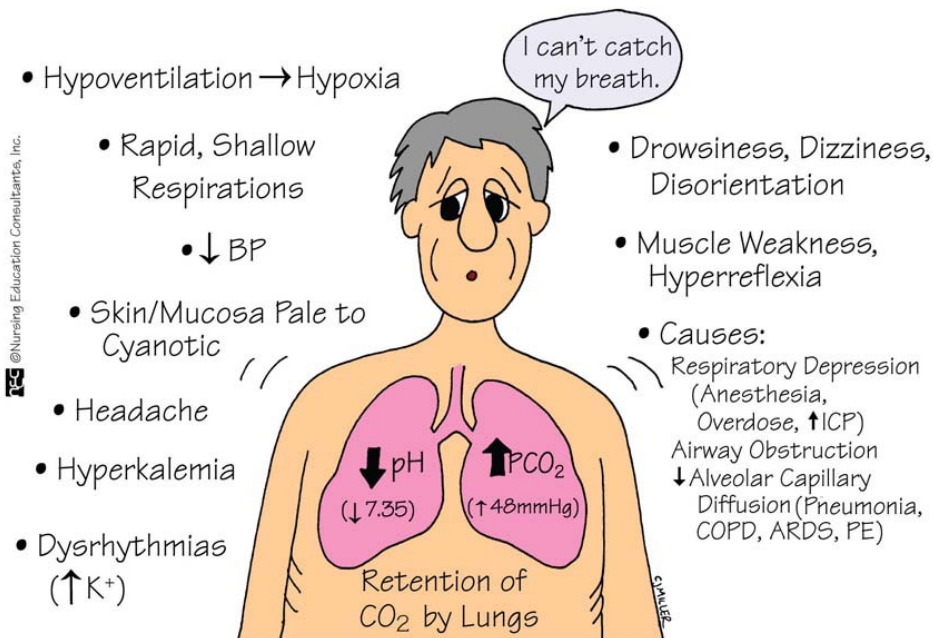

• Respiratory acidosis

- Inefficient expulsion of CO_2 , increased concentration of H_2CO_3 , impaired-respiration pathologies (pneumonia, emphysema, asthma)

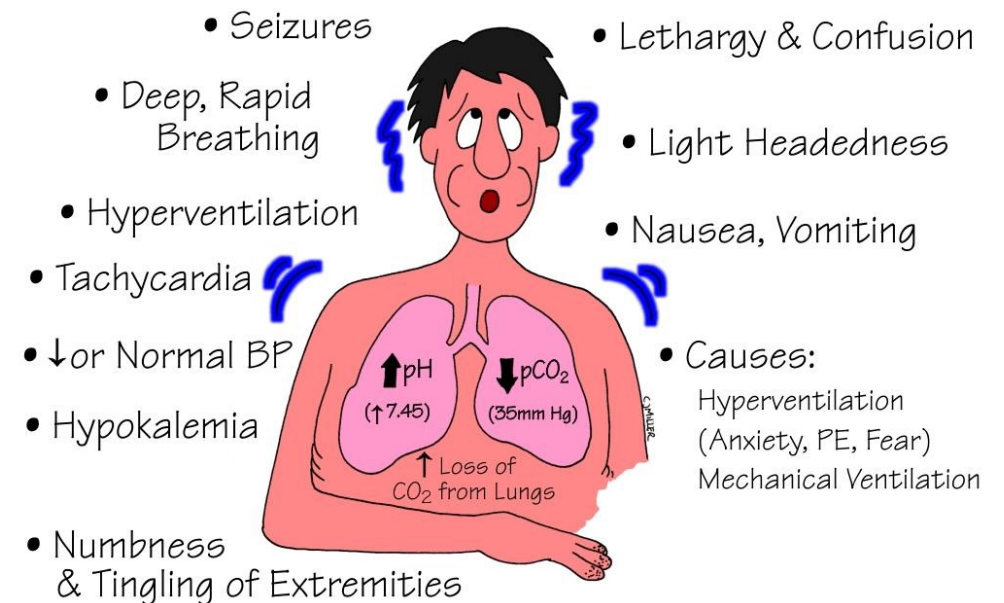

• Respiratory alkalosis

- Excessive CO_2 removal, decreased concentration of H_2CO_3 , hyperventilation

RESPIRATORY ACIDOSIS

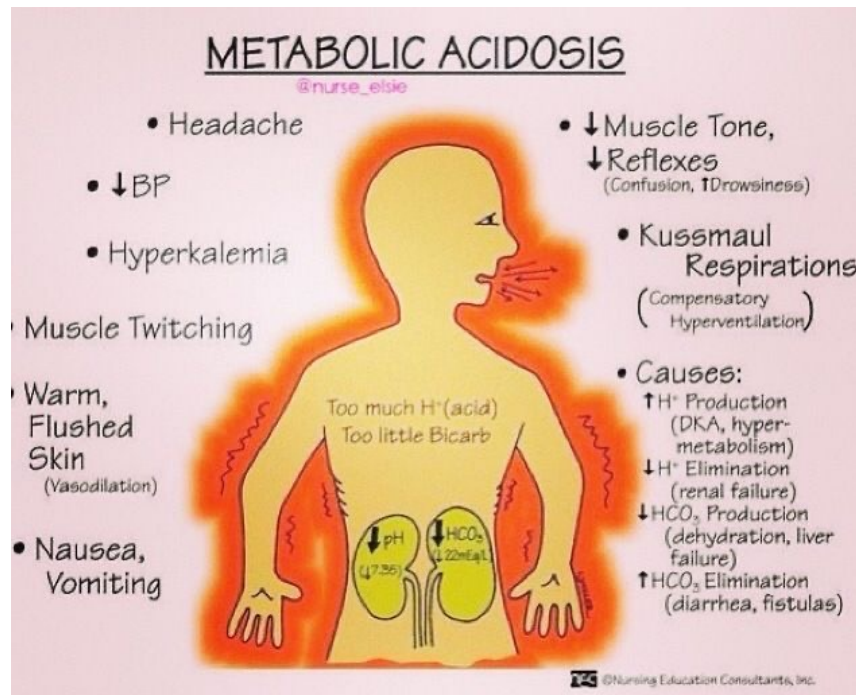

RESPIRATORY ALKALOSIS

Identifying common physiological buffers

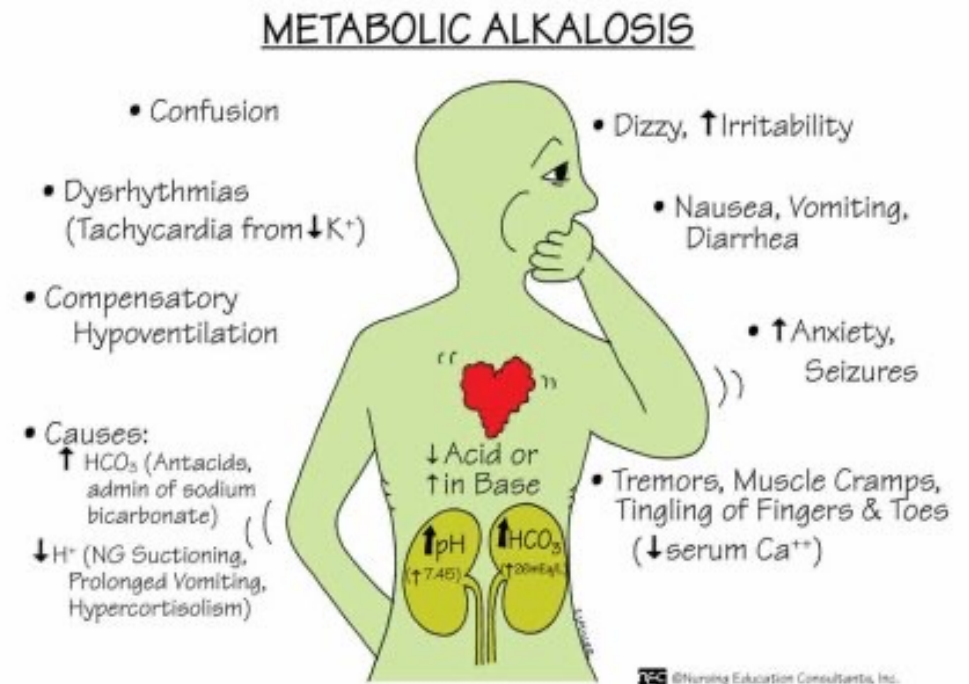

- Metabolic acidosis

- Decreased concentration of HCO_3^- , results from various kidney diseases, uncontrolled diabetes, or vomiting of non-acid fluids

- Metabolic alkalosis

- Increased concentration of HCO_3^- , results excessive vomiting of stomach acid

Identifying common physiological buffers

- **PROTEIN BUFFER SYSTEM**

- Protein buffer system helps to maintain acidity in and around cells

- **PHOSPHATE BUFFER SYSTEM**

- Phosphate buffer helps to maintain intracellular and urine pH

- **BICARBONATE BUFFER**

- main extracellular buffer, main blood buffer

- Helps in controlling CO₂ levels $\rightarrow \text{CO}_2 + \text{H}_2\text{O} \leftrightarrow \text{H}_2\text{CO}_3 \leftrightarrow \text{H}^+ + \text{HCO}_3^-$
- Coupled with CO₂ (blood) \leftrightarrow CO₂ (lungs)

Buffer action and the pH of blood

- Normal blood pH = 7.4
 - Kept at this value by the buffering action of HCO₃⁻, resulting from these two parallel physiological equilibria:
 - CO₂ + H₂O <--> H₂CO₃
 - H₂CO₃ <--> H⁺ + HCO₃⁻

- $K_{eq} = [H^+][HCO_3^-]/[CO_2]^* = 7.95 \times 10^{-7} \rightarrow pK_{eq} = 6.1$

- Rearranging:

$$[H^+] = K_{eq} \times [CO_2]/[HCO_3^-] \rightarrow -\log[H^+] = -\log K_{eq} - \log[CO_2]/[HCO_3^-] \rightarrow \text{pH} = pK_{eq} + \log[HCO_3^-]/[CO_2]$$

*[H₂O] = 55.6 M = const = included in the K_{eq} value

Quiz time

- A patient suffering from acidosis had a blood pH of 7.15 and a CO_2 concentration of 1.15 mM. If the reference range for pH = 7.4 are:

$[\text{HCO}_3^-] = 22.0 - 26.0 \text{ mM}$ (average = 24 mM)

$[\text{CO}_2] = 1.20 \text{ mM}$

and pK_{eq} for the bicarbonate buffer = 6.1:

- Q1. What was the patient's bicarbonate (HCO_3^-) concentration?
- Q2. What are the implications of this value to the buffer capacity of the blood?

Quiz time

R1.

$$\text{pH} = \text{pK}_{\text{eq}} + \log\left[\frac{[\text{HCO}_3^-]}{[\text{CO}_2]}\right] \rightarrow 7.15 = 6.1 + \log\left[\frac{[\text{HCO}_3^-]}{(1.15 \times 10^{-3})}\right]$$

$$10^{1.05} = \frac{[\text{HCO}_3^-]}{(1.15 \times 10^{-3})} \rightarrow [\text{HCO}_3^-] = 12.9 \times 10^{-3} \rightarrow [\text{HCO}_3^-] = 12.9 \text{ mM}$$

R2.

Normal $[\text{HCO}_3^-]$ average value = 24 mM \rightarrow $[\text{HCO}_3^-]$ in patient lowered by 11.1 mM \rightarrow severely impaired buffer capacity \rightarrow any further, small acid production will have serious consequences for the patient
