

Introduction to ROOT: part 2

Mirco Dorigo mirco.dorigo@ts.infn.it

LACD 2024-2025 March 21st, 2025

Breve annuncio per studenti di particelle

- Ogni anno la <u>CSN1</u> (esperimenti ad acceleratori) dell'INFN offre O(10) borse di **3 mesi per progetti in lab internazionali**: CERN (Svizzera), KEK (Giappone), Fermilab (US), PSI (Svizzera), BEPC (Cina)
- Sono rivolte a laureandi e/o neolaureati magistrali.
- Progetti: presentati da ricercatori/prof. solitamente verso ottobre/novembre, generalmente legati a progetti di tesi.
- Bando esce a dicembre/gennaio, risultato selezione a fine marzo.
 Il progetto puo' essere fatto nel periodo da aprile a fine ottobre.
 Per farvi un'idea, <u>vedete quello del 2025</u>.
- A Trieste abbiamo avuto un buon record di studenti vincitori.
 Se interessati per il 2026, meglio prendere contatti già verso ottobre.

Previous lesson

- Done a very quick (and incomplete) refresh of C++.
 NOT sufficient to learn C++. Enough for this course.
- You will learn writing macros through the examples for the realistic analysis we will do together.
- The realistic analysis uses Belle II data. We will search for the rare $B^0 \to K^+ \pi^-$ decay.

Data from Belle II

- We start from a txt file which contains the momenta of candidates kaon and pion of selected events, as measured in the centre-of-mass (CM) of the $\Upsilon(4S)$.
- $B^0 \to K^+\pi^-$ candidates are searched for by computing the invariant mass of the kaon-pion system: the signal should peak at the expected B^0 mass.
- In $\Upsilon(4S) \to B\overline{B}$ decays, each *B*-meson energy is $\sqrt{s/2}$ in the CM. Since this energy is well known^{*}, we will use it in the mass calculation:

$$M = \sqrt{s/4 - |\vec{p}_B^*|^2}$$

* $\sqrt{s} \simeq 10.5794 \,\mathrm{GeV}$

Our data

5

- Need to read the data from the txt file: write a script for this.
- Check that we are correctly reading the file:
 - do I open the correct file?
 - check the first 10 events (10 lines) while reading
 - do I read all events?

• Nothing special ...

The interesting part

• Closing...

The output is

mb-md-01:secondLesson dorigo\$ mb-md-01:secondLesson dorigo\$ root -1 readData.C root [0] Processing readData.C... cand 0 k_p(0.193687,-2.001170,-1.325680) cand 1 k_p(0.753111,2.462670,-0.931541) cand 2 k_p(-2.135140,1.349680,-0.693332) k_p(0.030545,2.036180,1.597180) cand 3 cand 4 k_p(-2.318040,-0.747861,0.964579) k_p(-1.850690,0.557923,1.608770) cand 5 cand 6 k_p(-1.061200,1.868110,1.670970) cand 7 k_p(0.936175,1.831010,-1.855890) cand 8 k_p(1.644320,0.097930,-2.071020) k_p(-1.114390,1.518820,2.007230) cand 9 Number of candidates: 31523 root [1]

• Take histoPx.C

• Take histoPx.C

40	<pre>while(file_in.is_open()){</pre>
41	
42	file_in >> k_px >> k_py >> k_pz
43	>> pi_px >> pi_py >> pi_pz;
44	
45	<pre>if(file_in.eof()) break;</pre>
46	
47	<pre>h_px->Fill(k_px);</pre>
48	
49	++icand;
50	
51	}

Get information from the histogram

63	//finally, draw it!	
64	<pre>TCanvas* c = new TCanvas("c","c",800,600);</pre>	
65	h_px->Draw();	Make a canvas, draw there,
66	c->SaveAs("histo_px_K.pdf");	Save in a ndf (or ineq dif C)
67		
68	return;	
69		
70	}	

• The output

- Plot the histogram yourself.
- What does it happens if:
 - you use 40000 (or 4) bins?
 - you change the x-axis range?
- Let's explore the histogram "live"

Setting a (default) drawing style

- Can put some default setting in a macro called rootlong.C
- · No need to call the macro, it is loaded by default.

Saving data in a ROOT format

- Can save data (and any ROOT object) in a compressed binary form in a ROOT file.
- ROOT provides a tree-like data structure, extremely powerful for fast access of huge amounts of data. ROOT files can have a sub-structure: they can contain directories.
- The file is in a **machine-independent** compressed binary format, including both data and their description

Data structures

- Simple model: many copies of the same linear data-structure (a "record"), ending up into a bidimensional data structure (a "table").
- The tables are named "n-tuples", as in mathematics, the records are called "events", as in physics, and the column headers are called "variables", as in computer science.
- ROOT provides more than n-tuples, "tree": same data structure used in OS to save files into folders that may contain other folders.
- A tree have "branches": simple variables or more complex objects
- A variable is the end point of a branch, a "leaf" in the ROOT jargon.

• Take makeTree.C

• Here it is the structure of our tree:

• Fill the tree

```
while(file_in.is_open()){
    file_in >> k_px >> k_py >> k_pz
                         >> pi_px >> pi_py >> pi_pz;
    if(file_in.eof()) break;
    h_px->Fill(k_px);
    dataTree->Fill();
    ++icand;
}
```

• Save in a ROOT file. We can also store the histogram.

Make a Tree	
	[mb-md-01:secondLesson dorigo\$ root -1 makeTree.C root [0]
• The output	Processing makeTree.C Number of candidates: 31523 Candidates in the tree: 31523

	** ** root [1]

Take home messages

- 1. We learnt how to read a txt file to take input data (formatted as a table "columns of variables, rows of events").
 - Always double check what you are reading.
- 2. Convert (immediately) your data into a TTree
 - It enables **easier inspections. Check the data** in an interactive ROOT session.
- 3. We learnt also how to plot an histogram. This is usually done after knowing what we want/expect to see.

Exercises

- 1. We still have to see a signal peak... Modify the macro to plot the histogram of $p_x(K)$:
 - A. For each event, using the K and π momenta, their known masses, and the CM energy, calculate the invariant mass M defined in slide 4. You can either do the calculation by hand or use the class <u>TLorentzVector</u>, which deals with 4-vectors. Plot the distribution of M.
 - B. A key variable is the difference between the measured *B* energy (in the CM) and half of the collision energy, $\Delta E = E^* \sqrt{s/2}$. Calculate the variable for each event and plot the distribution.
 - C. Describe the *M* and ΔE distributions (mean, standard dev...): do they look as expected?
- 2. Modify makeTree.C to add these two new variables to the TTree and save the tree in a file.
- 3. Have a look at the macro computeP.C from the lesson material see next slides. Try to understand and run it, see the use of standard C++ libraries (vector, numeric) and another ROOT class (TVector3). Modify the macro to add the plot of the momentum variable calculated there.

Compute a momentum

• Look at computeP.C

Compute a momentum

• Look at computeP.C

29	while(f	ile_in.is_open()){
30		
31	//r	ead the data in a line
32	fil	.e_in >> k_px >> k_py >> k_pz
33		>> pi_px >> pi_py >> pi_pz;
34		
35	//w	hen reach end-of-file, exit the loop
36	if(file_in.eof()) break;
37		
38	//1	et's compute the momentum vector
39	TVo	ractor 2 k 2n(k n x k n x k n z)
40		compute the magnitude of the vector
41 1/2	dou	ble k n = k $3n_1Man()$:
43		
44	k p	all.push back(k p); Append an element at the end,
45		the size of the vector arows
46	//j	ust have a look
47	if(icand<10)
48		printf("cand %i: \t k_p=%0.3f GeV/c \n",icand, k_p_all.at(icand));
49		//k_p_all[icand]
50	++i	
51	}	Easily access any element of the vector

Compute a momentum and an average

Just std-library show-off

```
//close input stream
52
       file_in.close();
53
54
                                          Number of elements in the vector
       // just print the total number
       cout << "Total data is: " << k_p_all.size() < endl;</pre>
56
57
       //compute the mean of the K mometum
       //using the vector and the std library numeric
59
       double k_p_mean = accumulate(k_p_all.begin(), k_p_all.end(), 0.0) / k_p_all.size();
61
       //now goes the mean in the squares, again with std library numeric
62
63
       double k_p_meanSquares =
            inner_product(k_p_all.begin(), k_p_all.end(), k_p_all.begin(), 0.0) / k_p_all.size();
64
       //to get the standard deviation
       double k_p_stdDev = sqrt(k_p_meanSquares - k_p_mean * k_p_mean);
66
67
       cout << "Mean value of K_p (GeV/c): " << k_p_mean << endl;
68
       cout << "Std dev of K_p (GeV/c): " << k_p_stdDev << endl;</pre>
69
70
71
       return;
72
73
  }
```

Compute a momentum and an average

...and what do you expect???

NB: $m(B) = 5280 \text{ MeV/c}^2$, $m(K) = 494 \text{ MeV/c}^2$, $m(\pi) = 140 \text{ MeV/c}^2$

Compute a momentum and an average
