Abstract: The oxidative coupling of 2 -naphthols suspended in aqueous Fe^{$3+$} solutions gives corresponding $1,1'-b$ i-2-naphthols in the yields of 91-95%. This reaction can be also effectively applied to the large-scale synthesis of $1,1'-b-2$ -naphthol. It was suggested that the oxidation occurred at the surface of the crystalline 2 -naphthols via a solid-liquid process.

INTRODUCTION

 $1, 1' - Bi -2$ -naphthol derivatives have been widely used in asymmetric synthesis as chirality inducers.l Because the enantiomerically pure binaphthols can be easily obtained from their racemates by a number of methods, including classical resolution via crystallization of diastereoisomeric derivatives,² formation of inclusion crystals with chiral host molecules,³ deracemization of racemates with copper complexes of chiral amines⁴ or enzymatic hydrolysis of esters,5 it is essential to establish a simple and convenient method for the preparation of racemic $1,1'$ -binaphthol derivatives. Several procedures have been developed for this purpose.⁶ For example, two molecules of 2-naphthol 1 can be coupled by using Fe^{3+} , Cu²⁺ or Mn³⁺ as the oxidants to produce binaphthol 2. In all cases, the reactions were carried out in organic media. F. Toda and his coworkers reported a solid-state oxidative coupling procedure for the preparation of binaphthol derivatives and found that the reaction proceeds faster and more efficiently in the solid state than in solution.⁷ In this paper, we describe a novel synthetic method for $1,1'-b-2$ -naphthols $2(a-b)$ via oxidative coupling of 2-naphthols $1(a-b)$ suspended in aqueous $Fe³⁺$ solutions.

RESULTS AND DISCUSSION

Synthesis of $1,1' - Bi - 2-naphthols$ **2**

From synthetic point of view, chemists always expect an organic reaction to proceed effectively and selectively under mild conditions without need of special reagents. As we noted in the introduction, the syntheses of $1,1'-bi-2-naphth$ were usually performed in organic media by the oxidative coupling of corresponding 2-naphthols. However, in such a case the reactions sometimes give quinones as byproducts.7 Recently we found that the coupling reaction of 2-naphthols suspended in aqueous $Fe³⁺$ solution procceeds much faster and more efficiently than in homogeneous solution.

Scheme I

As a typical run, a suspension of powdered 2 -naphthol $1a(1.0 g, 7 mmol)$ in water (20 mL) containing FeCl₃ • 6H₂ O (3.8 g, 14 mmol) was stirred at 50 °C for 1 h under air atmosphere. The crude product 2a was separated quantitatively by filtration and washed with distilled water to remove Fe^{3+} and Fe^{2+} . Recrystallization of the product from toluene gave pure 2a as white needles in 95% yield. Its melting point, IR and IH NMR data were identical to

| Oxidants | $\overline{\mathrm{Fe}^{3+}}$: la | Temp.(C) | Time (h) | Yield of $2a$ (%) |
|-------------------------------|------------------------------------|--------------|----------|-------------------|
| $FeCl3 \cdot 6H2O$ | 2:1 | 50 | | 95 |
| $FeCl3 \cdot 6H2O$ | 1:1 | 50 | | 90 |
| $FeCl3 \cdot 6H2O$ | 1:2 | 50 | | 85 |
| $FeCl3 \cdot 6H2O$ | 1:2 | 50 | | $80*$ |
| $FeCl3 \cdot 6H2O$ | 2:1 | r.t. | 55 | 90 |
| $FeCl3 \cdot 6H2O$ | 1:4 | 50 | 24 | 40 |
| $NH_4FeCl_4 \cdot 6H_2O$ | 2:1 | 50 | | 95 |
| $Fe(NO3)3$ • $9H2O$ | 2:1 | 50 | | 95 |
| $Fe2(SO4)3 \cdot 9H2O$ | 4:1 | 50 | 3 | 96 |
| $Fe2(SO4)3 \cdot 9H2O$ | 4:1 | 50 | | 75 |
| $NH_4Fe(SO_4)_2 \cdot 12H_2O$ | 2:1 | 50 | ٦ | 92 |
| $NH_4Fe(SO_4)_2 \cdot 12H_2O$ | 2:1 | 50 | | 80 |

Table 1. Coupling oxidation of 2-naphthol la in water media.

* The reaction was conducted under N2 atmosphere.

those of literature and a commercial $1,1'-b$ -2-naphthol sample. Considering the insolubility of 2 -naphthol in water, we suggest that the reaction occurs at the surface of crystalline 2 -naphthol via a solid-liquid process.

Some factors which may influence the yield of the reaction were also examined and summarized in Table 1. It was found that the oxidative coupling of la in aqueous FeCl3 solution gives 2a in high yields, which are comparable to those of solid-state reaction.7 Contrarily, heating of a solution of 1a and $FeCl₃ \cdot 6H₂O$ (1:2 molar ratio) in 50% aqueous methanol under reflux for 2 h gave 2a in 60% yield.⁷ It is apparent that the reaction in aqueous suspension is more efficient than in homogeneous solution. Several kinds of other $Fe³⁺$ salts were also used as the oxidants. In every case, the reaction proceeds effectively. When the molar ratio of oxidants ($Fe³⁺$) to 2-naphthol were altered from 2:1 to 1:2, the yield of reaction ranged from 95% to 85%. The reaction also occurred at room temperature, but the rate decreased significantly. When the reaction was conducted at r.t. for 55 h, the yield of coupling product was 90%.

In the case of $6-b$ romo -2 -naphthol 1b, the coupling reaction did not proceed at room temperature. Increasing the reaction temperature (70 °C) and prolonging the reaction time (17 h) result in the coupling product 2b in 91% yield.

The present reaction can be also applied to large-scale synthesis of 2a. For example, a reaction using $1a(14.4 g, 100 mmol)$, FeCl₃ \cdot 6H₂O (54.1 g, 200 mmol) and water(200 mL) gave 13.0 g of pure 2a(91% yield) after recrystallization of the crude product from toluene. Because the reaction was carried out with an aqueous suspension of the substrates under mild conditions and gave oxidative coupling products in excellent yields, it provided a convenient and economic route for the synthesis of $1,1'-bi-2-naphthols$.

Mechanism Remarks

F. Toda reported that the coupling reaction of 2 -naphthol 1a by FeCl₃ in the solid state was caused by one electron oxidation of la to the radical species la" which underwent dimerization followed by releasing two protons to give $1,1'-bi-2-naphthol 2a$. However in the solid state it is very difficult for two radicals to dimerize because of the control of the crystal lattice.⁸ It is noteworthy that in the present system when the molar ratio of the oxidant ($Fe³⁺$) to 2-naphthol 1a is 1:2, the coupling reactions both under the air and under nitrogen atmosphere give $1,1'-b$ i-2-naphthol 2a in the yields of 85% and 80% respectively. We also found that the reaction proceeds very slow in the presence of a catalytic amount of FeC13. For example, when the molar ratio of la to FeC13 was 4:1 and the reaction was conducted at 50 \degree for 24 h under the air, the yield of 2a was only 40%. This result shows that the oxidation of Fe^{2+} to Fe^{3+} under the air in water is not so efficient as that in the solid state.7 All the facts mentioned above imply that the formation of one molecule of 2a only consumes one equivalent of $Fe³⁺$, which suggests that the radical species 1a resulted from one electron oxidation of la with $Fe³⁺$ adds to another neutral la to form a new C-C bond and generate carbinyl radical followed by elimination of H' which may be further oxidated by $O₂$ present in the air or nitrogen (without further purification) to release H^+ , to regain the aromatic state (Scheme 2). In the system of present study, $Fe³⁺$ cations homogeneously dispersing in water can readily contact with the surface of crystalline 2-naphthol to undergo one electron oxidation. Because the radical species la" formed in this way is situated in an environment with extremely high concentration of 1a, it quickly combines with another 2-naphthol molecule to form the coupling product. Therefore the reaction in water media exhibits higher speed and efficiency than that in homogeneous solution.

Scheme 2

CONCLUSION

In conclusion we have presented a novel two-phase oxidative coupling of 2 -naphthols suspended in aqueous $Fe³⁺$ solutions. It provides a convenient and economic procedure for the synthesis of $1,1'-bi-2-naphthols$. The solid-liquid phase synthesis has also provided a new synthetic methodology.

EXPERIMENTAL SECTION

General

Unless stated otherwise, all reagents and chemicals were obtained commercially and used without further purification. $6 - \text{Bromo} - 2 - \text{naphthol}$ 1b was prepared following the literature procedure9 Melting points were measured using a WC-1 microscopic apparatus and are uncorrected. Elemental analyses were determined on a Carlo Erba 1106 Elemental Analysizer. IR spectra were recorded on a Shimadzu 435 Spectrophotometer in KBr pellets. ¹H NMR and ¹³C NMR spectra were taken on a Bruker AC-80 Spectrometer in CDCl₃ with TMS as an internal standard ($\delta = 0$ ppm).

Synthesis of $1,1'-Bi-2-naphthols$ **2** $1,1'-Bi-2-naphthol$ (2a). To a solution of FeCl₃ • 6H₂O (3.8 g, 14 mmol) in distilled water (20 mL) was added powdered 2 -naphthol 1a (1.0 g, 7 mmol) at room temperature, and the suspension was stirred at 50 \mathbb{C} for 1 h. After cooling, the resulting solid was separated by filtration and washed with distilled water for three times to remove Fe^{3+} and Fe^{2+} . The crude product was dried at room temperature *in vacuo* and recrystallized from toluene (10 mL) to give pure $1,1'-b-2$ -naphthol 2a as white needles (0.95 g, 95% yield): m.p. $216-218$ °C (lit. μ m.p. 214-216 °C). IR: 3475, 3380, 3030, 1615, 1591, 1510, 1466, 1458, 1380, 1214, 1174, 1145, 1123, 821, 815, 750 cm⁻¹. ¹H NMR: δ 4.00(s, 2H), 7.00-7.48 (m, 8H), 7.80 - 8.00 (m, 4H). ¹³C NMR: δ 111.0, 117.8, 124.0, 124.2, 127.4, 128.4, 129.4, 131.3, 133.5, 152.8. Anal. calcd. for C₂₀H₁4O₂: C, 83.90; H, 4.93%. Found: C, 83.68; H, 4.91%.

 $6.6'$ - Dibromo - 1,1' - bi-2-naphthol (2b). Following the procedure mentioned above, the suspension was stirred at 70 \degree C for 17 h. Recrystallization of the crude product from toluene gave 6, 6'-dibromo-l, $1'$ -bi-2-naphthol 2b as white crystals in 91% yield: m.p. $202-205$ °C (lit. Φ m.p. 208 - 209 °C), IR: 3501, 3440, 1619, 1590, 1500, 1387, 1355, 1320, 1220, 1170, 1150, 932, 880, 820 cm⁻¹. ¹H NMR: δ 5.26 (s, 2H), 6.93(d, 2H, J=8.9), 7.24 - 7.42(m, 4H), 7.95(d, 2H, J = 8.0), 8.01(d, 2H, J = 2.0). ¹³C NMR: δ 111.0, 118.0, 119.0, 125.9, 130.5, 130.7, 130.9, 131.3, 132.4, 153.0. Anal. calcd. for C₂₀H₁₂Br₂O₂: C, 54.09; H, 2.72%. Found: C, 53.70; H, 2.63%.

Large-scale synthesis of 2a. To a 500-mL Bunsen flask were added la (14.4 g, 100 mmol), FeCl₃ • $6H₂O$ (54.1 g, 200 mmol) and distilled water (200 mL), and the mixture was stirred vigorously with a magnetic stirrer at 50 \degree for 3 h. The reaction mixture was cooled to room temperature and filtered. The Filtered solid was washed with distilled water and recrystallized from toluene to give colourless 2a (13.0 g, 91% yield).
