Abundance of essential metallic elements in living organisms

Metal	g/75 kg
Na	70 – 120
K	160 – 200
Ca	1100
Mg	25
Fe	4 – 5
Zn	2 – 3
Cu	$80 - 120 \times 10^{-3}$
V	15×10^{-3}
Mn	1×10^{-2}
Co	1.2×10^{-3}
Mo	10×10^{-3}
Ni	?

Average intracellular concentration in eucariotic cells:

$[\text{Fe}]_{\text{total}} = 0.5 \text{ mM}$

$[\text{Zn}]_{\text{total}} = 0.5 \text{ mM}$

$[\text{Cu}]_{\text{total}} = 50 \text{ } \mu\text{M}$

$[\text{Fe}]$ corresponds to ca. 10^6 Fe atoms per cell

Metallome

Each species is characterized by a specific
metallome

Defined as the pool of metals that are present in each type of cell of that species, each one with its specific **amount**, **speciation**, and **localization** inside each cell

How an element can be established as being essential for a particular species?

An **essential** element is defined as one that is systematically present in a certain biological species and such that its absence (or deficiency) in the nutrient sources of that species causes disease, metabolic or developmental disorders. Negative effects are also caused by its excess.

Dose-response curve

Element	Deficiency symptoms	Excess symptoms
Ca	Delay in skeletal growth	
Mg	Muscle cramps, convulsions	
Fe	Anemia, disorders in the immune system	Oxidative stress
Zn	Damage to the skin, delayed sexual maturation	
Cu	Weakness of the arteries, liver disorders, secondary anemia, Menkes Syndrome	Wilson Syndrome
Mn	Infertility, reduced skeletal growth	Psychiatric disorders
Mo	Delay in cell growth, propensity to caries	Anemia
Co	Pernicious anemia	Cardiac disorders
Si	Disorders in skeletal growth	
F	Caries	
I	Gout, Thyroid disorders, delayed metabolism	Gout
Se	Muscle weakness, cardiomyopathy	
As	Delayed growth	

Bioavailability of the elements

Great Oxygenation Event

In 200 million years the atmospheric concentration of O_2 increased 10^4 times

The Great Oxygenation Event

Redox potentials accessible in water at pH 7: between -0.4 V (H^+/H_2) and $+0.8\text{ V}$ (O_2/OH^-)

Primeval redox potentials accessible in water at pH 7: between -0.4 V (H^+/H_2) and $\text{ca.}0.0\text{ V}$ ($\text{S}_\text{n}/\text{H}_2\text{S}$)

Pourbaix diagram

$$E = 1.23\text{ V} - (0.059\text{ V} \times \text{pH})$$

$$E^\circ(\text{Fe}^{3+}/\text{Fe}^{2+}) = + 0.77\text{ V}$$

$$E = -0.059\text{ V} \times \text{pH}$$

Banded iron bed

	Bio-availability	
Element	Reducing environment (anaerobic)	Oxidizing environment (aerobic)
Fe	Fe(II), (high)	Fe(III), (low)
Cu	as sulfide CuS (low)	Cu(II), (moderate)
S	HS ⁻ (high)	SO ₄ ²⁻ (high)
Mo	MoS ₂ , (MoO _n S _{4-n}) ²⁻ (low)	MoO ₄ ²⁻ (moderate)
V	V ³⁺ , sulfides of V(IV) (moderate)	VO ₄ ³⁻ (moderate)

*The **bio-availability** of an element in aqueous solution depends not only on its **abundance** but also on its **speciation** (i.e., in what form it is found) and the **solubility** of its compounds*

Roles of metals in biological systems

Structural role

Endo- and exoskeletons, stabilization of DNA, RNA and proteins

Functional role

- Charge transport (Na^+ , K^+ , Ca^{2+})
- Synthesis and metabolism of organic molecules (Lewis acids: Zn^{2+} , Mg^{2+})
- Electron transfer ($\text{Fe}^{2+/3+}$, $\text{Cu}^{+/2+}$)
- Activation of small molecules, O_2 , N_2 , CO_2 (Fe, Cu, Mn, Mo...). Assets: capacity of providing unpaired electrons, σ -donation + π -acceptance
- Organometallic reactivity (Co): radical production, reductive alkylation

Biological ligands

Anions

Water

Aminoacid side-chains

Histidine (His)

$R = \text{CH}_2\text{SH}$
 Cysteine (Cys), $\text{pK}_a = 8.5$

$R = -\text{CH}_2\text{CH}_2\text{SCH}_3$
Methionine (Met)

Tyrosine, $\text{pK}_a = 10$

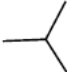

Glutamate (Glu): $R = -\text{CH}_2\text{CH}_2\text{COO}^-$ Aspartate (Asp): $R = -\text{CH}_2\text{COO}^-$
 $\text{pK}_a = 4.5$

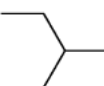

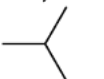

Amino acids with non-polar side chains:

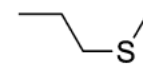

Gly R = —H

Ala R = —

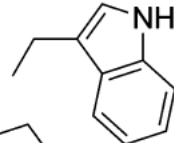

Val R = 

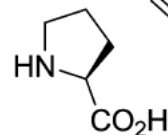

Leu R = 

Ile R = 

Met R =

Glu-Cys-Gly

0.5 – 10 mM intracellular
(also a monoelectronic reductant)

Endogenous reducing agents

Electron transfer enzymes

Ascorbic acid: 11–79 μM in the blood

Glutathione: 0.5 – 10 mM intracellular

Watson-Crick type hydrogen bonds

Tetrapyrrole ligands

Porphyrin²⁻

Corrin⁻

vitamin B₁₂ (X = CN)

Type	Cations	Donor atoms
<i>Hard</i>	H^+ , Na^+ , K^+ , Mg^{2+} , Ca^{2+} , Mn^{2+} , Mn^{3+} , Fe^{3+}	Oxygen in H_2O , OH^- , OR^- , O^{2-} , PO_4^{3-} , NO_3^- , CO_3^{2-} , RCOO^- (including glu, asp, tyr, ser, thr), $-\text{C}=\text{O}$ (peptide), F^- , Cl^- , NH_3
<i>Soft</i>	Cu^+ , Ag^+ , Pt^{2+} , Cd^{2+} , Hg^+ , Hg^{2+}	CN^- , CO , S^{2-} , RSH e R_2S (including cys and met), I^-
Borderline	Fe^{2+} , Co^{2+} , Ni^{2+} , Cu^{2+} , Zn^{2+}	Any N, O and S donor

Table 2.6 Typical coordination environments of metal centers in proteins

metal oxidation state	bond stability	typical number and type of side chain ligands	typical coordination geometry
Zn(II)	high	3: His, Cys ⁻ , (Glu ⁻)	severely distorted tetrahedron
Cu(I)	high	3,4: His, Cys ⁻ , Met	severely distorted tetrahedron
Cu(II)	high	3,4: His, (Cys ⁻)	distorted square planar arrangement
Fe(II), Ni(II) Co(II), Mg(II)	low	4-6: His, Glu ⁻ , Asp ⁻	distorted octahedron
Fe(III)	high	4-6: Glu ⁻ , Asp ⁻ , Tyr ⁻ , Cys ⁻	distorted octahedron
