

TMS320C28x Extended Instruction Sets

Technical Reference Manual

Literature Number: SPRUHS1
March 2014

Preface	5
1 Floating Point Unit (FPU)	7
1.1 Overview	8
1.1.1 Compatibility with the C28x Fixed-Point CPU	8
1.2 Components of the C28x plus Floating-Point CPU	9
1.2.1 Emulation Logic	10
1.2.2 Memory Map	10
1.2.3 On-Chip Program and Data	10
1.2.4 CPU Interrupt Vectors	10
1.2.5 Memory Interface	10
1.3 CPU Register Set	11
1.3.1 CPU Registers	11
1.4 Pipeline	17
1.4.1 Pipeline Overview	17
1.4.2 General Guidelines for Floating-Point Pipeline Alignment	18
1.4.3 Moves from FPU Registers to C28x Registers	18
1.4.4 Moves from C28x Registers to FPU Registers	19
1.4.5 Parallel Instructions	19
1.4.6 Invalid Delay Instructions	20
1.4.7 Optimizing the Pipeline	23
1.5 Floating Point Unit Instruction Set	24
1.5.1 Instruction Descriptions	24
1.5.2 Instructions	27
2 C28 Viterbi, Complex Math and CRC Unit-II (VCU-II)	138
2.1 Overview	139
2.2 Components of the C28x Plus VCU	140
2.2.1 Emulation Logic	142
2.2.2 Memory Map	142
2.2.3 CPU Interrupt Vectors	142
2.2.4 Memory Interface	142
2.2.5 Address and Data Buses	142
2.2.6 Alignment of 32-Bit Accesses to Even Addresses	143
2.3 Register Set	144
2.3.1 VCU Register Set	145
2.3.2 VCU Status Register (VSTATUS)	147
2.3.3 Repeat Block Register (RB)	150
2.4 Pipeline	152
2.4.1 Pipeline Overview	152
2.4.2 General Guidelines for VCU Pipeline Alignment	152
2.4.3 Parallel Instructions	153
2.4.4 Invalid Delay Instructions	154
2.5 Instruction Set	157
2.5.1 Instruction Descriptions	157
2.5.2 General Instructions	159
2.5.3 Arithmetic Math Instructions	202

2.5.4	Complex Math Instructions	209
2.5.5	Cyclic Redundancy Check (CRC) Instructions.....	269
2.5.6	Deinterleaver Instructions.....	285
2.5.7	FFT Instructions.....	301
2.5.8	Galois Instructions	329
2.5.9	Viterbi Instructions	342
2.6	Rounding Mode	377
3	Trigonometric Math Unit (TMU).....	379
3.1	Overview	380
3.2	Components of the C28x+FPU Plus TMU.....	380
3.2.1	Interrupt Context Save and Restore.....	380
3.3	Data Format	380

Read This First

This document describes the architecture, pipeline, and instruction sets of the TMU, VCU-II, and FPU accelerators.

About This Manual

The TMS320C2000™ digital signal processor (DSP) platform is part of the TMS320™ DSP family.

Notational Conventions

This document uses the following conventions.

- Hexadecimal numbers are shown with the suffix h or with a leading 0x. For example, the following number is 40 hexadecimal (decimal 64): 40h or 0x40.
- Registers in this document are shown as figures and described in tables.
 - Each register figure shows a rectangle divided into fields that represent the fields of the register. Each field is labeled with its bit name, its beginning and ending bit numbers above, and its read/write properties below. A legend explains the notation used for the properties
 - Reserved bits in a register figure designate a bit that is used for future device expansion.

Related Documentation

The following books describe the TMS320x28x and related support tools that are available on the TI website:

Data Manual and Errata—

SPRS439— [TMS320F28335, TMS320F28334, TMS320F28332, TMS320F28235, TMS320F28234, TMS320F28232 Digital Signal Controllers \(DSCs\) Data Manual](#) contains the pinout, signal descriptions, as well as electrical and timing specifications for the F2833x/2823x devices.

SPRZ272— [TMS320F28335, F28334, F28332, TMS320F28235, F28234, F28232 Digital Signal Controllers \(DSCs\) Silicon Errata](#) describes the advisories and usage notes for different versions of silicon.

CPU User's Guides—

SPRU430 — **TMS320C28x CPU and Instruction Set Reference Guide** describes the central processing unit (CPU) and the assembly language instructions of the TMS320C28x fixed-point digital signal processors (DSPs). It also describes emulation features available on these DSPs.

SPRU002 — **TMS320C28x Floating Point Unit and Instruction Set Reference Guide** describes the floating-point unit and includes the instructions for the FPU.

Peripheral Guides—

SPRU566 — **TMS320x28xx, 28xxx DSP Peripheral Reference Guide** describes the peripheral reference guides of the 28x digital signal processors (DSPs).

SPRUFB0 — **TMS320x2833x, 2823x System Control and Interrupts Reference Guide** describes the various interrupts and system control features of the 2833x and 2823x digital signal controllers (DSCs).

SPRU812 — **TMS320x2833x, 2823x Analog-to-Digital Converter (ADC) Reference Guide** describes how to configure and use the on-chip ADC module, which is a 12-bit pipelined ADC.

SPRU949 — **TMS320x2833x, 2823x DSC External Interface (XINTF) Reference Guide** describes the XINTF, which is a nonmultiplexed asynchronous bus, as it is used on the 2833x and 2823x devices.

[SPRU963](#) — TMS320x2833x, 2823x Boot ROM Reference Guide describes the purpose and features of the bootloader (factory-programmed boot-loading software) and provides examples of code. It also describes other contents of the device on-chip boot ROM and identifies where all of the information is located within that memory.

[SPRUFB7](#) — TMS320x2833x, 2823x Multichannel Buffered Serial Port (McBSP) Reference Guide describes the McBSP available on the 2833x and 2823x devices. The McBSPs allow direct interface between a DSP and other devices in a system.

[SPRUFB8](#) — TMS320x2833x, 2823x Direct Memory Access (DMA) Module Reference Guide describes the DMA on the 2833x and 2823x devices.

[SPRUG04](#) — TMS320x2833x, 2823x Enhanced Pulse Width Modulator (ePWM) Module Reference Guide describes the main areas of the enhanced pulse width modulator that include digital motor control, switch mode power supply control, UPS (uninterruptible power supplies), and other forms of power conversion.

[SPRUG02](#) — TMS320x2833x, 2823x High-Resolution Pulse Width Modulator (HRPWM) Reference Guide describes the operation of the high-resolution extension to the pulse width modulator (HRPWM).

[SPRUFG4](#) — TMS320x2833x, 2823x Enhanced Capture (eCAP) Module Reference Guide describes the enhanced capture module. It includes the module description and registers.

[SPRUG05](#) — TMS320x2833x, 2823x Enhanced Quadrature Encoder Pulse (eQEP) Module Reference Guide describes the eQEP module, which is used for interfacing with a linear or rotary incremental encoder to get position, direction, and speed information from a rotating machine in high-performance motion and position control systems. It includes the module description and registers.

[SPRUEU1](#) — TMS320x2833x, 2823x Enhanced Controller Area Network (eCAN) Reference Guide describes the eCAN that uses established protocol to communicate serially with other controllers in electrically noisy environments.

[SPRUZF5](#) — TMS320x2833x, 2823x Serial Communications Interface (SCI) Reference Guide describes the SCI, which is a two-wire asynchronous serial port, commonly known as a UART. The SCI modules support digital communications between the CPU and other asynchronous peripherals that use the standard non-return-to-zero (NRZ) format.

[SPRUEU3](#) — TMS320x2833x, 2823x DSC Serial Peripheral Interface (SPI) Reference Guide describes the SPI - a high-speed synchronous serial input/output (I/O) port - that allows a serial bit stream of programmed length (one to sixteen bits) to be shifted into and out of the device at a programmed bit-transfer rate.

[SPRUG03](#) — TMS320x2833x, 2823x Inter-Integrated Circuit (I2C) Module Reference Guide describes the features and operation of the inter-integrated circuit (I2C) module.

Tools Guides—

[SPRU513](#) — TMS320C28x Assembly Language Tools v5.0.0 User's Guide describes the assembly language tools (assembler and other tools used to develop assembly language code), assembler directives, macros, common object file format, and symbolic debugging directives for the TMS320C28x device.

[SPRU514](#) — TMS320C28x Optimizing C/C++ Compiler v5.0.0 User's Guide describes the TMS320C28x™ C/C++ compiler. This compiler accepts ANSI standard C/C++ source code and produces TMS320 DSP assembly language source code for the TMS320C28x device.

[SPRU608](#) — TMS320C28x Instruction Set Simulator Technical Overview describes the simulator, available within the Code Composer Studio for TMS320C2000 IDE, that simulates the instruction set of the C28x™ core.

[SPRU625](#) — TMS320C28x DSP/BIOS 5.32 Application Programming Interface (API) Reference Guide describes development using DSP/BIOS.

Floating Point Unit (FPU)

The TMS320C2000™ DSP family consists of fixed-point and floating-point digital signal controllers (DSCs). TMS320C2000™ Digital Signal Controllers combine control peripheral integration and ease of use of a microcontroller (MCU) with the processing power and C efficiency of TI's leading DSP technology. This chapter provides an overview of the architectural structure and components of the C28x plus floating-point unit CPU.

Topic	Page
1.1 Overview.....	8
1.2 Components of the C28x plus Floating-Point CPU	9
1.3 CPU Register Set	11
1.4 Pipeline.....	17
1.5 Floating Point Unit Instruction Set.....	24

1.1 Overview

The C28x plus floating-point (C28x+FPU) processor extends the capabilities of the C28x fixed-point CPU by adding registers and instructions to support IEEE single-precision floating point operations. This device draws from the best features of digital signal processing; reduced instruction set computing (RISC); and microcontroller architectures, firmware, and tool sets. The DSC features include a modified Harvard architecture and circular addressing. The RISC features are single-cycle instruction execution, register-to-register operations, and modified Harvard architecture (usable in Von Neumann mode). The microcontroller features include ease of use through an intuitive instruction set, byte packing and unpacking, and bit manipulation. The modified Harvard architecture of the CPU enables instruction and data fetches to be performed in parallel. The CPU can read instructions and data while it writes data simultaneously to maintain the single-cycle instruction operation across the pipeline. The CPU does this over six separate address/data buses.

Throughout this document the following notations are used:

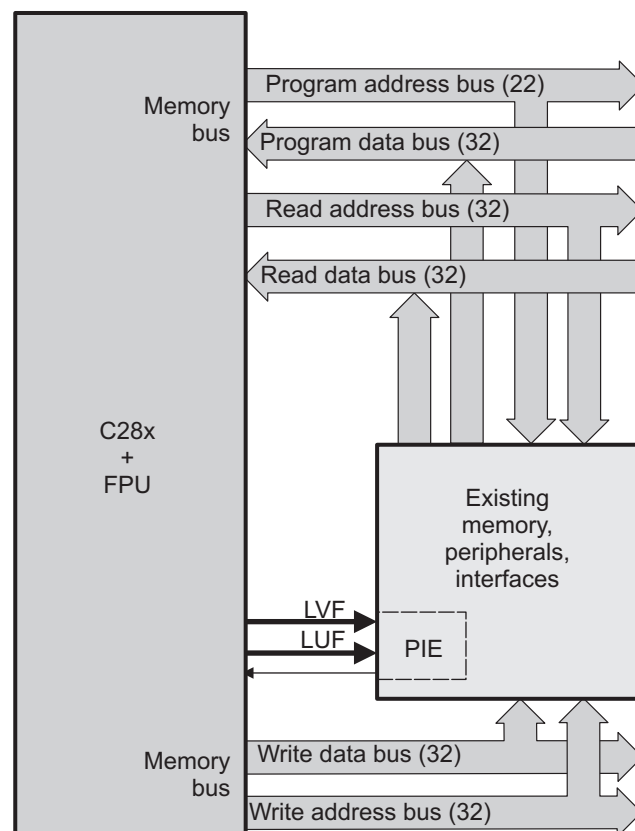

- C28x refers to the C28x fixed-point CPU.
- C28x plus Floating-Point and C28x+FPU both refer to the C28x CPU with enhancements to support IEEE single-precision floating-point operations.

1.1.1 Compatibility with the C28x Fixed-Point CPU

No changes have been made to the C28x base set of instructions, pipeline, or memory bus architecture. Therefore, programs written for the C28x CPU are completely compatible with the C28x+FPU and all of the features of the C28x documented in *TMS320C28x DSP CPU and Instruction Set Reference Guide* (literature number [SPRU430](#)) apply to the C28x+FPU.

[Figure 1-1](#) shows basic functions of the FPU.

Figure 1-1. FPU Functional Block Diagram

1.1.1.1 Floating-Point Code Development

When developing C28x floating-point code use Code Composer Studio 3.3, or later, with at least service release 8. The C28x compiler V5.0, or later, is also required to generate C28x native floating-point opcodes. This compiler is available via Code Composer Studio update advisor as a separate download. V5.0 can generate both fixed-point as well as floating-point code. To build floating-point code use the compiler switches: -v28 and -float_support = fpu32. In Code Composer Studio 3.3 the float_support option is in the build options under compiler-> advanced: floating point support. Without the float_support flag, or with float_support = none, the compiler will generate fixed-point code.

When building for C28x floating-point make sure all associated libraries have also been built for floating-point. The standard run-time support (RTS) libraries built for floating-point included with the compiler have fpu32 in their name. For example rts2800_fpu32.lib and rts2800_fpu_eh.lib have been built for the floating-point unit. The "eh" version has exception handling for C++ code. Using the fixed-point RTS libraries in a floating-point project will result in the linker issuing an error for incompatible object files.

To improve performance of native floating-point projects, consider using the *C28x FPU Fast RTS Library* ([SPRC664](#)). This library contains hand-coded optimized math routines such as division, square root, atan2, sin and cos. This library can be linked into your project before the standard runtime support library to give your application a performance boost. As an example, the standard RTS library uses a polynomial expansion to calculate the sin function. The Fast RTS library, however, uses a math look-up table in the boot ROM of the device. Using this look-up table method results in approximately a 20 cycle savings over the standard RTS calculation.

1.2 Components of the C28x plus Floating-Point CPU

The C28x+FPU contains:

- A central processing unit for generating data and program-memory addresses; decoding and executing instructions; performing arithmetic, logical, and shift operations; and controlling data transfers among CPU registers, data memory, and program memory
- A floating-point unit for IEEE single-precision floating point operations.
- Emulation logic for monitoring and controlling various parts and functions of the device and for testing device operation. This logic is identical to that on the C28x fixed-point CPU.
- Signals for interfacing with memory and peripherals, clocking and controlling the CPU and the emulation logic, showing the status of the CPU and the emulation logic, and using interrupts. This logic is identical to the C28x fixed-point CPU.

Some features of the C28x+FPU central processing unit are:

- Fixed-Point instructions are pipeline protected. This pipeline for fixed-point instructions is identical to that on the C28x fixed-point CPU. The CPU implements an 8-phase pipeline that prevents a write to and a read from the same location from occurring out of order. See [Figure 1-5](#).
- Some floating-point instructions require pipeline alignment. This alignment is done through software to allow the user to improve performance by taking advantage of required delay slots.
- Independent register space. These registers function as system-control registers, math registers, and data pointers. The system-control registers are accessed by special instructions.
- Arithmetic logic unit (ALU). The 32-bit ALU performs 2s-complement arithmetic and Boolean logic operations.
- Floating point unit (FPU). The 32-bit FPU performs IEEE single-precision floating-point operations.
- Address register arithmetic unit (ARAU). The ARAU generates data memory addresses and increments or decrements pointers in parallel with ALU operations.
- Barrel shifter. This shifter performs all left and right shifts of fixed-point data. It can shift data to the left by up to 16 bits and to the right by up to 16 bits.
- Fixed-Point Multiplier. The multiplier performs 32-bit × 32-bit 2s-complement multiplication with a 64-bit result. The multiplication can be performed with two signed numbers, two unsigned numbers, or one signed number and one unsigned number.

1.2.1 Emulation Logic

The emulation logic is identical to that on the C28x fixed-point CPU. This logic includes the following features:

- Debug-and-test direct memory access (DT-DMA). A debug host can gain direct access to the content of registers and memory by taking control of the memory interface during unused cycles of the instruction pipeline.
- A counter for performance benchmarking.
- Multiple debug events. Any of the following debug events can cause a break in program execution:
 - A breakpoint initiated by the ESTOP0 or ESTOP1 instruction.
 - An access to a specified program-space or data-space location.
 When a debug event causes the C28x to enter the debug-halt state, the event is called a break event.
- Real-time mode of operation.

For more details about these features, refer to the *TMS320C28x DSP CPU and Instruction Set Reference Guide* (literature number [SPRU430](#)).

1.2.2 Memory Map

Like the C28x, the C28x+FPU uses 32-bit data addresses and 22-bit program addresses. This allows for a total address reach of 4G words (1 word = 16 bits) in data space and 4M words in program space. Memory blocks on all C28x+FPU designs are uniformly mapped to both program and data space. For specific details about each of the map segments, see the data sheet for your device.

1.2.3 On-Chip Program and Data

All C28x+FPU based devices contain at least two blocks of single access on-chip memory referred to as M0 and M1. Each of these blocks is 1K words in size. M0 is mapped at addresses 0x0000 – 0x03FF and M1 is mapped at addresses 0x0400 – 0x07FF. Like all other memory blocks on the C28x+FPU devices, M0 and M1 are mapped to both program and data space. Therefore, you can use M0 and M1 to execute code or for data variables. At reset, the stack pointer is set to the top of block M1. Depending on the device, it may also have additional random-access memory (RAM), read-only memory (ROM), external interface zones, or flash memory.

1.2.4 CPU Interrupt Vectors

The C28x+FPU interrupt vectors are identical to those on the C28x CPU. Sixty-four addresses in program space are set aside for a table of 32 CPU interrupt vectors. The CPU vectors can be mapped to the top or bottom of program space by way of the VMAP bit. For more information about the CPU vectors, see *TMS320C28x DSP CPU and Instruction Set Reference Guide* (literature number [SPRU430](#)). For devices with a peripheral interrupt expansion (PIE) block, the interrupt vectors will reside in the PIE vector table and this memory can be used as program memory.

1.2.5 Memory Interface

The C28x+FPU memory interface is identical to that on the C28x. The C28x+FPU memory map is accessible outside the CPU by the memory interface, which connects the CPU logic to memories, peripherals, or other interfaces. The memory interface includes separate buses for program space and data space. This means an instruction can be fetched from program memory while data memory is being accessed. The interface also includes signals that indicate the type of read or write being requested by the CPU. These signals can select a specified memory block or peripheral for a given bus transaction. In addition to 16-bit and 32-bit accesses, the C28x+FPU supports special byte-access instructions that can access the least significant byte (LSByte) or most significant byte (MSByte) of an addressed word. Strobe signals indicate when such an access is occurring on a data bus.

1.2.5.1 Address and Data Buses

Like the C28x, the memory interface has three address buses:

- **PAB: Program address bus**

The PAB carries addresses for reads and writes from program space. PAB is a 22-bit bus.

- **DRAB: Data-read address bus**

The 32-bit DRAB carries addresses for reads from data space.

- **DWAB: Data-write address bus**

The 32-bit DWAB carries addresses for writes to data space.

The memory interface also has three data buses:

- **PRDB: Program-read data bus**

The PRDB carries instructions during reads from program space. PRDB is a 32-bit bus.

- **DRDB: Data-read data bus**

The DRDB carries data during reads from data space. DRDB is a 32-bit bus.

- **DWDB: Data-/Program-write data bus**

The 32-bit DWDB carries data during writes to data space or program space.

A program-space read and a program-space write cannot happen simultaneously because both use the PAB. Similarly, a program-space write and a data-space write cannot happen simultaneously because both use the DWDB. Transactions that use different buses can happen simultaneously. For example, the CPU can read from program space (using PAB and PRDB), read from data space (using DRAB and DRDB), and write to data space (using DWAB and DWDB) at the same time. This behavior is identical to the C28x CPU.

1.2.5.2 Alignment of 32-Bit Accesses to Even Addresses

The C28x+FPU CPU expects memory wrappers or peripheral-interface logic to align any 32-bit read or write to an even address. If the address-generation logic generates an odd address, the CPU will begin reading or writing at the previous even address. This alignment does not affect the address values generated by the address-generation logic.

Most instruction fetches from program space are performed as 32-bit read operations and are aligned accordingly. However, alignment of instruction fetches are effectively invisible to a programmer. When instructions are stored to program space, they do not have to be aligned to even addresses. Instruction boundaries are decoded within the CPU.

You need to be concerned with alignment when using instructions that perform 32-bit reads from or writes to data space.

1.3 CPU Register Set

The C28x+FPU architecture is the same as the C28x CPU with an extended register and instruction set to support IEEE single-precision floating point operations. This section describes the extensions to the C28x architecture

1.3.1 CPU Registers

Devices with the C28x+FPU include the standard C28x register set plus an additional set of floating-point unit registers. The additional floating-point unit registers are the following:

- Eight floating-point result registers, RnH (where n = 0 - 7)
- Floating-point Status Register (STF)
- Repeat Block Register (RB)

All of the floating-point registers except the repeat block register are shadowed. This shadowing can be used in high priority interrupts for fast context save and restore of the floating-point registers.

Figure 1-2 shows a diagram of both register sets and Table 1-1 shows a register summary. For information on the standard C28x register set, see the *TMS320C28x DSP CPU and Instruction Set Reference Guide* (literature number [SPRU430](#)).

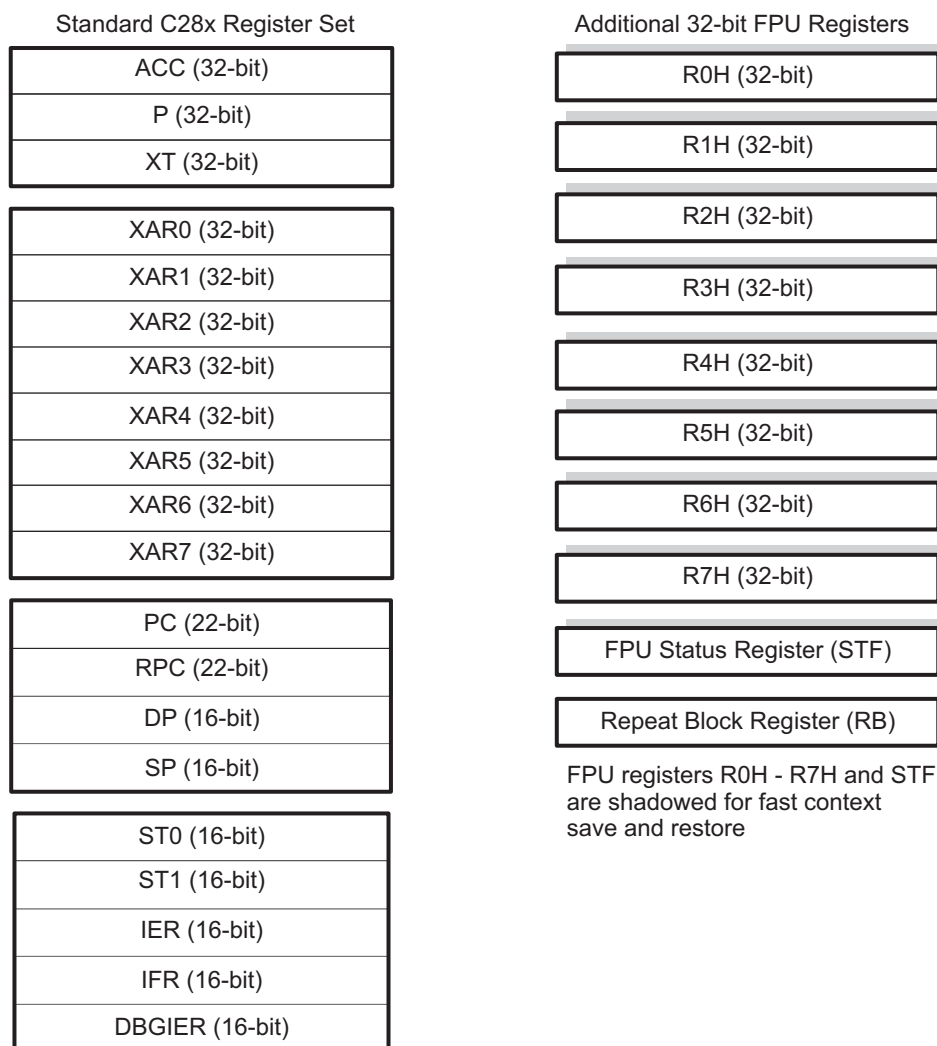

Figure 1-2. C28x With Floating-Point Registers

Table 1-1. 28x Plus Floating-Point CPU Register Summary

Register	C28x CPU	C28x+FPU	Size	Description	Value After Reset
ACC	Yes	Yes	32 bits	Accumulator	0x00000000
AH	Yes	Yes	16 bits	High half of ACC	0x0000
AL	Yes	Yes	16 bits	Low half of ACC	0x0000

R4H	No	Yes	32 bits	Floating-point result register 4	0.0
R5H	No	Yes	32 bits	Floating-point result register 5	0.0
R6H	No	Yes	32 bits	Floating-point result register 6	0.0
R7H	No	Yes	32 bits	Floating-point result register 7	0.0
STF	No	Yes	32 bits	Floating-point status register	0x00000000
RB	No	Yes	32 bits	Repeat block register	0x00000000

⁽¹⁾ Reset value shown is for devices without the VMAP signal and MOM1MAP signal pinned out. On these devices both of these signals are tied high internal to the device.

1.3.1.1 Floating-Point Status Register (STF)

The floating-point status register (STF) reflects the results of floating-point operations. There are three basic rules for floating point operation flags:

1. Zero and negative flags are set based on moves to registers.
2. Zero and negative flags are set based on the result of compare, minimum, maximum, negative and absolute value operations.
3. Overflow and underflow flags are set by math instructions such as multiply, add, subtract and 1/x. These flags may also be connected to the peripheral interrupt expansion (PIE) block on your device. This can be useful for debugging underflow and overflow conditions within an application.

As on the C28x, program flow is controlled by C28x instructions that read status flags in the status register 0 (ST0). If a decision needs to be made based on a floating-point operation, the information in the STF register needs to be loaded into ST0 flags (Z,N,OV,TC,C) so that the appropriate branch conditional instruction can be executed. The **MOVST0 FLAG** instruction is used to load the current value of specified STF flags into the respective bits of ST0. When this instruction executes, it will also clear the latched overflow and underflow flags if those flags are specified.

Example 1-1. Moving STF Flags to the ST0 Register

```

Loop:
MOV32  R0H,*XAR4++
MOV32  R1H,*XAR3++
CMPF32 R1H, R0H
MOVST0 ZF, NF          ; Move ZF and NF to ST0
BF     Loop, GT         ; Loop if (R1H > R0H)

```

Figure 1-3. Floating-point Unit Status Register (STF)

31	30											16
SHDWS	Reserved

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-2. Floating-point Unit Status (STF) Register Field Descriptions

Bits	Field	Value	Description
31	SHDWS	0 1	Shadow Mode Status Bit This bit is forced to 0 by the RESTORE instruction. This bit is set to 1 by the SAVE instruction. This bit is not affected by loading the status register either from memory or from the shadow values.
30 - 10	Reserved	0	Reserved for future use
9	RND32	0 1	Round 32-bit Floating-Point Mode If this bit is zero, the MPYF32, ADDF32 and SUBF32 instructions will round to zero (truncate). If this bit is one, the MPYF32, ADDF32 and SUBF32 instructions will round to the nearest even value.
8 - 7	Reserved	0	Reserved for future use
6	TF	0 1	Test Flag The TESTTF instruction can modify this flag based on the condition tested. The SETFLG and SAVE instructions can also be used to modify this flag. 0 The condition tested with the TESTTF instruction is false. 1 The condition tested with the TESTTF instruction is true.

Table 1-2. Floating-point Unit Status (STF) Register Field Descriptions (continued)

Bits	Field	Value	Description
5	ZI	0 1	<p>Zero Integer Flag</p> <p>The following instructions modify this flag based on the integer value stored in the destination register: MOV32, MOVD32, MOVDD32 The SETFLG and SAVE instructions can also be used to modify this flag.</p> <p>The integer value is not zero.</p> <p>The integer value is zero.</p>
4	NI	0 1	<p>Negative Integer Flag</p> <p>The following instructions modify this flag based on the integer value stored in the destination register: MOV32, MOVD32, MOVDD32 The SETFLG and SAVE instructions can also be used to modify this flag.</p> <p>The integer value is not negative.</p> <p>The integer value is negative.</p>
3	ZF	0 1	<p>Zero Floating-Point Flag ^{(1) (2)}</p> <p>The following instructions modify this flag based on the floating-point value stored in the destination register: MOV32, MOVD32, MOVDD32, ABSF32, NEGF32 The CMPF32, MAXF32, and MINF32 instructions modify this flag based on the result of the operation. The SETFLG and SAVE instructions can also be used to modify this flag</p> <p>The floating-point value is not zero.</p> <p>The floating-point value is zero.</p>
2	NF	0 1	<p>Negative Floating-Point Flag ^{(3) (4)}</p> <p>The following instructions modify this flag based on the floating-point value stored in the destination register: MOV32, MOVD32, MOVDD32, ABSF32, NEGF32 The CMPF32, MAXF32, and MINF32 instructions modify this flag based on the result of the operation. The SETFLG and SAVE instructions can also be used to modify this flag.</p> <p>The floating-point value is not negative.</p> <p>The floating-point value is negative.</p>
1	LUF	0 1	<p>Latched Underflow Floating-Point Flag</p> <p>The following instructions will set this flag to 1 if an underflow occurs: MPYF32, ADDF32, SUBF32, MACF32, EINVF32, EISQRTF32</p> <p>An underflow condition has not been latched. If the MOVST0 instruction is used to copy this bit to ST0, then LUF will be cleared.</p> <p>An underflow condition has been latched.</p>
0	LVF	0 1	<p>Latched Overflow Floating-Point Flag</p> <p>The following instructions will set this flag to 1 if an overflow occurs: MPYF32, ADDF32, SUBF32, MACF32, EINVF32, EISQRTF32</p> <p>An overflow condition has not been latched. If the MOVST0 instruction is used to copy this bit to ST0, then LVF will be cleared.</p> <p>An overflow condition has been latched.</p>

⁽¹⁾ A negative zero floating-point value is treated as a positive zero value when configuring the ZF and NF flags.

⁽²⁾ A DeNorm floating-point value is treated as a positive zero value when configuring the ZF and NF flags.

⁽³⁾ A negative zero floating-point value is treated as a positive zero value when configuring the ZF and NF flags.

⁽⁴⁾ A DeNorm floating-point value is treated as a positive zero value when configuring the ZF and NF flags.

1.3.1.2 Repeat Block Register (RB)

The repeat block instruction (RPTB) is a new instruction for C28x+FPU. This instruction allows you to repeat a block of code as shown in [Example 1-2](#).

Example 1-2. The Repeat Block (RPTB) Instruction uses the RB Register

```
; find the largest element and put its address in XAR6
MOV32  R0H, *XAR0++;
.align 2                                ; Aligns the next instruction to an even address

NOP                                     ; Makes RPTB odd aligned - required for a block size of 8
RPTB   VECTOR_MAX_END, AR7            ; RA is set to 1
MOVL   ACC, XAR0
MOV32  R1H, *XAR0++                   ; RSIZE reflects the size of the RPTB block
MAXF32 R0H, R1H                       ; in this case the block size is 8
MOVST0 NF, ZF
MOVL   XAR6, ACC, LT
VECTOR_MAX_END:                       ; RE indicates the end address. RA is cleared
```

The C28x_FPU hardware automatically populates the RB register based on the execution of a RPTB instruction. This register is not normally read by the application and does not accept debugger writes.

Figure 1-4. Repeat Block Register (RB)

31	30	29	23	22	16
RAS	RA	RSIZE		RE	
R-0	R-0	R-0		R-0	
15					0
RC					
R-0					

LEGEND: R = Read only; -n = value after reset

Table 1-3. Repeat Block (RB) Register Field Descriptions

Bits	Field	Value	Description
31	RAS	0 1	Repeat Block Active Shadow Bit When an interrupt occurs the repeat active, RA, bit is copied to the RAS bit and the RA bit is cleared. When an interrupt return instruction occurs, the RAS bit is copied to the RA bit and RAS is cleared. A repeat block was not active when the interrupt was taken. A repeat block was active when the interrupt was taken.
30	RA	0 1	Repeat Block Active Bit This bit is cleared when the repeat counter, RC, reaches zero. When an interrupt occurs the RA bit is copied to the repeat active shadow, RAS, bit and RA is cleared. When an interrupt return, IRET, instruction is executed, the RAS bit is copied to the RA bit and RAS is cleared. This bit is set when the RPTB instruction is executed to indicate that a RPTB is currently active.
29-23	RSIZE	0-7 8/9-0x7F	Repeat Block Size This 7-bit value specifies the number of 16-bit words within the repeat block. This field is initialized when the RPTB instruction is executed. The value is calculated by the assembler and inserted into the RPTB instruction's RSIZE opcode field. Illegal block size. A RPTB block that starts at an even address must include at least 9 16-bit words and a block that starts at an odd address must include at least 8 16-bit words. The maximum block size is 127 16-bit words. The codegen assembler will check for proper block size and alignment.

Table 1-3. Repeat Block (RB) Register Field Descriptions (continued)

Bits	Field	Value	Description
22-16	RE		Repeat Block End Address This 7-bit value specifies the end address location of the repeat block. The RE value is calculated by hardware based on the RSIZE field and the PC value when the RPTB instruction is executed. $RE = \text{lower 7 bits of } (PC + 1 + RSIZE)$
15-0	RC	0 1-0xFFFF	Repeat Count The block will not be repeated; it will be executed only once. In this case the repeat active, RA, bit will not be set. This 16-bit value determines how many times the block will repeat. The counter is initialized when the RPTB instruction is executed and is decremented when the PC reaches the end of the block. When the counter reaches zero, the repeat active bit is cleared and the block will be executed one more time. Therefore the total number of times the block is executed is RC+1.

1.4 Pipeline

The pipeline flow for C28x instructions is identical to that of the C28x CPU described in *TMS320C28x DSP CPU and Instruction Set Reference Guide* ([SPRU430](#)). Some floating-point instructions, however, use additional execution phases and thus require a delay to allow the operation to complete. This pipeline alignment is achieved by inserting NOPs or non-conflicting instructions when required. Software control of delay slots allows you to improve performance of an application by taking advantage of the delay slots and filling them with non-conflicting instructions. This section describes the key characteristics of the pipeline with regards to floating-point instructions. The rules for avoiding pipeline conflicts are small in number and simple to follow and the C28x+FPU assembler will help you by issuing errors for conflicts.

1.4.1 Pipeline Overview

The C28x FPU pipeline is identical to the C28x pipeline for all standard C28x instructions. In the decode2 stage (D2), it is determined if an instruction is a C28x instruction or a floating-point unit instruction. The pipeline flow is shown in [Figure 1-5](#). Notice that stalls due to normal C28x pipeline stalls (D2) and memory waitstates (R2 and W) will also stall any C28x FPU instruction. Most C28x FPU instructions are single cycle and will complete in the FPU E1 or W stage which aligns to the C28x pipeline. Some instructions will take an additional execute cycle (E2). For these instructions you must wait a cycle for the result from the instruction to be available. The rest of this section will describe when delay cycles are required. Keep in mind that the assembly tools for the C28x+FPU will issue an error if a delay slot has not been handled correctly.

Figure 1-5. FPU Pipeline

1.4.2 General Guidelines for Floating-Point Pipeline Alignment

While the C28x+FPU assembler will issue errors for pipeline conflicts, you may still find it useful to understand when software delays are required. This section describes three guidelines you can follow when writing C28x+FPU assembly code.

Floating-point instructions that require delay slots have a 'p' after their cycle count. For example '2p' stands for 2 pipelined cycles. This means that an instruction can be started every cycle, but the result of the instruction will only be valid one instruction later.

There are three general guidelines to determine if an instruction needs a delay slot:

1. Floating-point math operations (multiply, addition, subtraction, 1/x and MAC) require 1 delay slot.
2. Conversion instructions between integer and floating-point formats require 1 delay slot.
3. Everything else does not require a delay slot. This includes minimum, maximum, compare, load, store, negative and absolute value instructions.

There are two exceptions to these rules. First, moves between the CPU and FPU registers require special pipeline alignment that is described later in this section. These operations are typically infrequent. Second, the MACF32 R7H, R3H, mem32, *XAR7 instruction has special requirements that make it easier to use. Refer to the MACF32 instruction description for details.

An example of the 32-bit ADDF32 instruction is shown in [Example 1-3](#). ADDF32 is a 2p instruction and therefore requires one delay slot. The destination register for the operation, R0H, will be updated one cycle after the instruction for a total of 2 cycles. Therefore, a NOP or instruction that does not use R0H must follow this instruction.

Any memory stall or pipeline stall will also stall the floating-point unit. This keeps the floating-point unit aligned with the C28x pipeline and there is no need to change the code based on the waitstates of a memory block.

Example 1-3. 2p Instruction Pipeline Alignment

```
ADDF32 R0H, #1.5, R1H    ; 2 pipeline cycles (2p)
NOP                      ; 1 cycle delay or non-conflicting instruction
                          ; <-- ADDF32 completes, R0H updated
NOP                      ; Any instruction
```

1.4.3 Moves from FPU Registers to C28x Registers

When transferring from the floating-point unit registers to the C28x CPU registers, additional pipeline alignment is required as shown in [Example 1-4](#) and [Example 1-5](#).

Example 1-4. Floating-Point to C28x Register Software Pipeline Alignment

```
; MINF32: 32-bit floating-point minimum: single-cycle operation
; An alignment cycle is required before copying R0H to ACC
MINF32 R0H, R1H          ; Single-cycle instruction
                          ; <-- R0H is valid
NOP                      ; Alignment cycle
MOV32 @ACC, R0H          ; Copy R0H to ACC
```

For 1-cycle FPU instructions, one delay slot is required between a write to the floating-point register and the transfer instruction as shown in [Example 1-4](#). For 2p FPU instructions, two delay slots are required between a write to the floating-point register and the transfer instruction as shown in [Example 1-5](#).

Example 1-5. Floating-Point to C28x Register Software Pipeline Alignment

```

; ADDF32: 32-bit floating-point addition: 2p operation
; An alignment cycle is required before copying R0H to ACC
ADDF32 R0H, R1H, #2      ; R0H = R1H + 2, 2 pipeline cycle instruction
NOP                      ; 1 delay cycle or non-conflicting instruction
                          ; <-- R0H is valid
NOP                      ; Alignment cycle
MOV32  @ACC, R0H         ; Copy R0H to ACC

```

1.4.4 Moves from C28x Registers to FPU Registers

Transfers from the standard C28x CPU registers to the floating-point registers require four alignment cycles. In this case the four alignment cycles can be filled with NOPs or any non-conflicting instruction except for FRACF32, UI16TOF32, I16TOF32, F32TOUI32, and F32TOI32. These instructions cannot replace any of the four alignment NOPs.

Example 1-6. C28x Register to Floating-Point Register Software Pipeline Alignment

```

; Four alignment cycles are required after copying a standard 28x CPU
; register to a floating-point register.
;
MOV32  R0H,@ACC          ; Copy ACC to R0H
NOP
NOP
NOP
NOP                      ; Wait 4 cycles
ADDF32 R2H,R1H,R0H       ; R0H is valid

```

1.4.5 Parallel Instructions

Parallel instructions are single opcodes that perform two operations in parallel. This can be a math operation in parallel with a move operation, or two math operations in parallel. Math operations with a parallel move are referred to as 2p/1 instructions. The math portion of the operation takes two pipelined cycles while the move portion of the operation is single cycle. This means that NOPs or other non-conflicting instructions must be inserted to align the math portion of the operation. An example of an add with parallel move instruction is shown in [Example 1-7](#).

Example 1-7. 2p/1 Parallel Instruction Software Pipeline Alignment

```

; ADDF32 || MOV32 instruction: 32-bit floating-point add with parallel move
; ADDF32 is a 2p operation
; MOV32 is a 1 cycle operation
;
ADDF32 R0H, R1H, #2      ; R0H = R1H + 2, 2 pipeline cycle operation
|| MOV32 R1H, @Val       ; R1H gets the contents of Val, single cycle operation
                          ; <-- MOV32 completes here (R1H is valid)
NOP                      ; 1 cycle delay or non-conflicting instruction
                          ; <-- ADDF32 completes here (R0H is valid)
NOP                      ; Any instruction

```

Parallel math instructions are referred to as 2p/2p instructions. Both math operations take 2 cycles to complete. This means that NOPs or other non-conflicting instructions must be inserted to align the both math operations. An example of a multiply with parallel add instruction is shown in [Example 1-8](#).

Example 1-8. 2p/2p Parallel Instruction Software Pipeline Alignment

```

; MPYF32 || ADDF32 instruction: 32-bit floating-point multiply with parallel add
; MPYF32 is a 2p operation
; ADDF32 is a 2p cycle operation
;
MPYF32 R0H, R1H, R3H ; R0H = R1H * R3H, 2 pipeline cycle operation
|| ADDF32 R1H, R2H, R4H ; R1H = R2H + R4H, 2 pipeline cycle operation
NOP ; 1 cycle delay or non-conflicting instruction
; <-- MPYF32 and ADDF32 complete here (R0H and R1H are valid)
NOP ; Any instruction

```

1.4.6 Invalid Delay Instructions

Most instructions can be used in delay slots as long as source and destination register conflicts are avoided. The C28x+FPU assembler will issue an error anytime you use an conflicting instruction within a delay slot. The following guidelines can be used to avoid these conflicts.

NOTE: *Destination register conflicts in delay slots:*

Any operation used for pipeline alignment delay must not use the same destination register as the instruction requiring the delay. See [Example 1-9](#).

In [Example 1-9](#) the MPYF32 instruction uses R2H as its destination register. The next instruction should not use R2H as its destination. Since the MOV32 instruction uses the R2H register a pipeline conflict will be issued by the assembler. This conflict can be resolved by using a register other than R2H for the MOV32 instruction as shown in [Example 1-10](#).

Example 1-9. Destination Register Conflict

```
; Invalid delay instruction. Both instructions use the same destination register
MPYF32 R2H, R1H, R0H      ; 2p instruction
MOV32 R2H, mem32          ; Invalid delay instruction
```

Example 1-10. Destination Register Conflict Resolved

```
; Valid delay instruction
MPYF32 R2H, R1H, R0H      ; 2p instruction MOV32 R1H, mem32
                          ; Valid delay
                          ; <-- MPYF32 completes, R2H valid
```

NOTE: *Instructions in delay slots cannot use the instruction's destination register as a source register.*

Any operation used for pipeline alignment delay must not use the destination register of the instruction requiring the delay as a source register as shown in [Example 1-11](#). For parallel instructions, the current value of a register can be used in the parallel operation before it is overwritten as shown in [Example 1-13](#).

In [Example 1-11](#) the MPYF32 instruction again uses R2H as its destination register. The next instruction should not use R2H as its source since the MPYF32 will take an additional cycle to complete. Since the ADDF32 instruction uses the R2H register a pipeline conflict will be issued by the assembler. This conflict can be resolved by using a register other than R2H or by inserting a non-conflicting instruction between the MPYF32 and ADDF32 instructions. Since the SUBF32 does not use R2H this instruction can be moved before the ADDF32 as shown in [Example 1-12](#).

Example 1-11. Destination/Source Register Conflict

```
; Invalid delay instruction.      ADDF32 should not use R2H as a source operand
MPYF32 R2H, R1H, R0H      ; 2p instruction
ADDF32 R3H, R3H, R2H      ; Invalid delay instruction
SUBF32 R4H, R1H, R0H
```

Example 1-12. Destination/Source Register Conflict Resolved

```
; Valid delay instruction.
MPYF32 R2H, R1H, R0H      ; 2p instruction
SUBF32 R4H, R1H, R0H      ; Valid delay for MPYF32
ADDF32 R3H, R3H, R2H      ; <-- MPYF32 completes, R2H valid
NOP                       ; <-- SUBF32 completes, R4H valid
```

It should be noted that a source register for the 2nd operation within a parallel instruction can be the same as the destination register of the first operation. This is because the two operations are started at the same time. The 2nd operation is not in the delay slot of the first operation. Consider [Example 1-13](#) where the MPYF32 uses R2H as its destination register. The MOV32 is the 2nd operation in the instruction and can freely use R2H as a source register. The contents of R2H before the multiply will be used by MOV32.

Example 1-13. Parallel Instruction Destination/Source Exception

```
; Valid parallel operation.
MPYF32 R2H, R1H, R0H ; 2p/1 instruction
|| MOV32 mem32, R2H ; <-- Uses R2H before the MPYF32
                     ; <-- mem32 updated
NOP                 ; <-- Delay for MPYF32
                     ; <-- R2H updated
```

Likewise, the source register for the 2nd operation within a parallel instruction can be the same as one of the source registers of the first operation. The MPYF32 operation in [Example 1-14](#) uses the R1H register as one of its sources. This register is also updated by the MOV32 register. The multiplication operation will use the value in R1H before the MOV32 updates it.

Example 1-14. Parallel Instruction Destination/Source Exception

```
; Valid parallel instruction
MPYF32 R2H, R1H, R0H ; 2p/1 instruction
|| MOV32 R1H, mem32 ; Valid
NOP                 ; <-- MOV32 completes, R1H valid
                     ; <-- MPYF32, R2H valid
```

NOTE: Operations within parallel instructions cannot use the same destination register.

When two parallel operations have the same destination register, the result is invalid.

For example, see [Example 1-15](#).

If both operations within a parallel instruction try to update the same destination register as shown in [Example 1-15](#) the assembler will issue an error.

Example 1-15. Invalid Destination Within a Parallel Instruction

```
; Invalid parallel instruction. Both operations use the same destination register
MPYF32 R2H, R1H, R0H ; 2p/1 instruction
|| MOV32 R2H, mem32 ; Invalid
```

Some instructions access or modify the STF flags. Because the instruction requiring a delay slot will also be accessing the STF flags, these instructions should not be used in delay slots. These instructions are SAVE, SETFLG, RESTORE and MOVST0.

NOTE: Do not use SAVE, SETFLG, RESTORE, or the MOVST0 instruction in a delay slot.

1.4.7 Optimizing the Pipeline

The following example shows how delay slots can be used to improve the performance of an algorithm. The example performs two $Y = MX+B$ operations. In [Example 1-16](#), no optimization has been done. The $Y = MX+B$ calculations are sequential and each takes 7 cycles to complete. Notice there are NOPs in the delay slots that could be filled with non-conflicting instructions. The only requirement is these instructions must not cause a register conflict or access the STF register flags.

Example 1-16. Floating-Point Code Without Pipeline Optimization

```
; Using NOPs for alignment cycles, calculate the following:
;
; Y1 = M1*X1 + B1
; Y2 = M2*X2 + B2
;
; Calculate Y1
;
MOV32    R0H,@M1           ; Load R0H with M1 - single cycle
MOV32    R1H,@X1           ; Load R1H with X1 - single cycle
MPYF32   R1H,R1H,R0H       ; R1H = M1 * X1 - 2p operation
|| MOV32  R0H,@B1           ; Load R0H with B1 - single cycle
NOP      ; Wait for MPYF32 to complete
          ; <-- MPYF32 completes, R1H is valid
ADDF32   R1H,R1H,R0H       ; R1H = R1H + R0H - 2p operation
NOP      ; Wait for ADDF32 to complete
          ; <-- ADDF32 completes, R1H is valid
MOV32    @Y1,R1H           ; Save R1H in Y1 - single cycle

; Calculate Y2

MOV32    R0H,@M2           ; Load R0H with M2 - single cycle
MOV32    R1H,@X2           ; Load R1H with X2 - single cycle
MPYF32   R1H,R1H,R0H       ; R1H = M2 * X2 - 2p operation
|| MOV32  R0H,@B2           ; Load R0H with B2 - single cycle
NOP      ; Wait for MPYF32 to complete
          ; <-- MPYF32 completes, R1H is valid
ADDF32   R1H,R1H,R0H       ; R1H = R1H + R0H
NOP      ; Wait for ADDF32 to complete
          ; <-- ADDF32 completes, R1H is valid
MOV32    @Y2,R1H           ; Save R1H in Y2
; 14 cycles
; 48 bytes
```

The code shown in [Example 1-17](#) was generated by the C28x+FPU compiler with optimization enabled. Notice that the NOPs in the first example have now been filled with other instructions. The code for the two $Y = MX+B$ calculations are now interleaved and both calculations complete in only nine cycles.

Example 1-17. Floating-Point Code With Pipeline Optimization

```

; Using non-conflicting instructions for alignment cycles,
; calculate the following:
;
; Y1 = M1*X1 + B1
; Y2 = M2*X2 + B2
;
MOV32    R2H,@X1        ; Load R2H with X1 - single cycle
MOV32    R1H,@M1        ; Load R1H with M1 - single cycle
MPYF32   R3H,R2H,R1H    ; R3H = M1 * X1 - 2p operation
| MOV32   R0H,@M2        ; Load R0H with M2 - single cycle
MOV32    R1H,@X2        ; Load R1H with X2 - single cycle
; <-- MPYF32 completes, R3H is valid
MPYF32   R0H,R1H,R0H    ; R0H = M2 * X2 - 2p operation
| MOV32   R4H,@B1        ; Load R4H with B1 - single cycle
; <-- MOV32 completes, R4H is valid
ADDF32   R1H,R4H,R3H    ; R1H = B1 + M1*X1 - 2p operation
| MOV32   R2H,@B2        ; Load R2H with B2 - single cycle
; <-- MPYF32 completes, R0H is valid
ADDF32   R0H,R2H,R0H    ; R0H = B2 + M2*X2 - 2p operation
; <-- ADDF32 completes, R1H is valid
MOV32    @Y1,R1H        ; Store Y1
; <-- ADDF32 completes, R0H is valid
MOV32    @Y2,R0H        ; Store Y2

; 9 cycles
; 36 bytes

```

1.5 Floating Point Unit Instruction Set

This chapter describes the assembly language instructions of the TMS320C28x plus floating-point processor. Also described are parallel operations, conditional operations, resource constraints, and addressing modes. The instructions listed here are an extension to the standard C28x instruction set. For information on standard C28x instructions, see the *TMS320C28x DSP CPU and Instruction Set Reference Guide* (literature number [SPRU430](#)).

1.5.1 Instruction Descriptions

This section gives detailed information on the instruction set. Each instruction may present the following information:

- Operands
- Opcode
- Description
- Exceptions
- Pipeline
- Examples
- See also

The example INSTRUCTION is shown to familiarize you with the way each instruction is described. The example describes the kind of information you will find in each part of the individual instruction description and where to obtain more information. On the C28x+FPU instructions, follow the same format as the C28x. The source operand(s) are always on the right and the destination operand(s) are on the left.

The explanations for the syntax of the operands used in the instruction descriptions for the TMS320C28x plus floating-point processor are given in [Table 1-4](#). For information on the operands of standard C28x instructions, see the *TMS320C28x DSP CPU and Instruction Set Reference Guide* ([SPRU430](#)).

Table 1-4. Operand Nomenclature

Symbol	Description
#16FHi	16-bit immediate (hex or float) value that represents the upper 16-bits of an IEEE 32-bit floating-point value. Lower 16-bits of the mantissa are assumed to be zero.
#16FHiHex	16-bit immediate hex value that represents the upper 16-bits of an IEEE 32-bit floating-point value. Lower 16-bits of the mantissa are assumed to be zero.
#16FLoHex	A 16-bit immediate hex value that represents the lower 16-bits of an IEEE 32-bit floating-point value
#32Fhex	32-bit immediate value that represents an IEEE 32-bit floating-point value
#32F	Immediate float value represented in floating-point representation
#0.0	Immediate zero
#RC	16-bit immediate value for the repeat count
*(0:16bitAddr)	16-bit immediate address, zero extended
CNDF	Condition to test the flags in the STF register
FLAG	Selected flags from STF register (OR) 11 bit mask indicating which floating-point status flags to change
label	Label representing the end of the repeat block
mem16	Pointer (using any of the direct or indirect addressing modes) to a 16-bit memory location
mem32	Pointer (using any of the direct or indirect addressing modes) to a 32-bit memory location
RaH	R0H to R7H registers
RbH	R0H to R7H registers
RcH	R0H to R7H registers
RdH	R0H to R7H registers
ReH	R0H to R7H registers
RfH	R0H to R7H registers
RB	Repeat Block Register
STF	FPU Status Register
VALUE	Flag value of 0 or 1 for selected flag (OR) 11 bit mask indicating the flag value; 0 or 1

INSTRUCTION dest1, source1, source2 Short Description

Operands

dest1	description for the 1st operand for the instruction
source1	description for the 2nd operand for the instruction
source2	description for the 3rd operand for the instruction

Each instruction has a table that gives a list of the operands and a short description. Instructions always have their destination operand(s) first followed by the source operand(s).

Opcode	This section shows the opcode for the instruction.
Description	Detailed description of the instruction execution is described. Any constraints on the operands imposed by the processor or the assembler are discussed.
Restrictions	Any constraints on the operands or use of the instruction imposed by the processor are discussed.
Pipeline	This section describes the instruction in terms of pipeline cycles as described in Section 1.4 .
Example	Examples of instruction execution. If applicable, register and memory values are given before and after instruction execution. All examples assume the device is running with the OBJMODE set to 1. Normally the boot ROM or the c-code initialization will set this bit.
See Also	Lists related instructions.

1.5.2 Instructions

The instructions are listed alphabetically, preceded by a summary.

Table 1-5. Summary of Instructions

Title	Page
ABSF32 RaH, RbH — 32-bit Floating-Point Absolute Value.....	29
ADDF32 RaH, #16FHi, RbH — 32-bit Floating-Point Addition.....	30
ADDF32 RaH, RbH, #16FHi — 32-bit Floating-Point Addition.....	32
ADDF32 RaH, RbH, RcH — 32-bit Floating-Point Addition.....	34
ADDF32 RdH, ReH, RfH MOV32 mem32, RaH — 32-bit Floating-Point Addition with Parallel Move.....	36
ADDF32 RdH, ReH, RfH MOV32 RaH, mem32 — 32-bit Floating-Point Addition with Parallel Move.....	38
CMPF32 RaH, RbH — 32-bit Floating-Point Compare for Equal, Less Than or Greater Than	40
CMPF32 RaH, #16FHi — 32-bit Floating-Point Compare for Equal, Less Than or Greater Than	41
CMPF32 RaH, #0.0 — 32-bit Floating-Point Compare for Equal, Less Than or Greater Than.....	43
EINVF32 RaH, RbH — 32-bit Floating-Point Reciprocal Approximation	44
EISQRTF32 RaH, RbH — 32-bit Floating-Point Square-Root Reciprocal Approximation	46
F32TOI16 RaH, RbH — Convert 32-bit Floating-Point Value to 16-bit Integer	48
F32TOI16R RaH, RbH — Convert 32-bit Floating-Point Value to 16-bit Integer and Round	49
F32TOI32 RaH, RbH — Convert 32-bit Floating-Point Value to 32-bit Integer	50
F32TOUI16 RaH, RbH — Convert 32-bit Floating-Point Value to 16-bit Unsigned Integer	51
F32TOUI16R RaH, RbH — Convert 32-bit Floating-Point Value to 16-bit Unsigned Integer and Round.....	52
F32TOUI32 RaH, RbH — Convert 32-bit Floating-Point Value to 16-bit Unsigned Integer	53
FRACF32 RaH, RbH — Fractional Portion of a 32-bit Floating-Point Value.....	54
I16TOF32 RaH, RbH — Convert 16-bit Integer to 32-bit Floating-Point Value	55
I16TOF32 RaH, mem16 — Convert 16-bit Integer to 32-bit Floating-Point Value	56
I32TOF32 RaH, mem32 — Convert 32-bit Integer to 32-bit Floating-Point Value	57
I32TOF32 RaH, RbH — Convert 32-bit Integer to 32-bit Floating-Point Value	58
MACF32 R3H, R2H, RdH, ReH, RfH — 32-bit Floating-Point Multiply with Parallel Add	59
MACF32 R3H, R2H, RdH, ReH, RfH MOV32 RaH, mem32 — 32-bit Floating-Point Multiply and Accumulate with Parallel Move	61
MACF32 R7H, R3H, mem32, *XAR7++ — 32-bit Floating-Point Multiply and Accumulate	63
MACF32 R7H, R6H, RdH, ReH, RfH — 32-bit Floating-Point Multiply with Parallel Add	65
MACF32 R7H, R6H, RdH, ReH, RfH MOV32 RaH, mem32 — 32-bit Floating-Point Multiply and Accumulate with Parallel Move	67
MAXF32 RaH, RbH — 32-bit Floating-Point Maximum	69
MAXF32 RaH, #16FHi — 32-bit Floating-Point Maximum	70
MAXF32 RaH, RbH MOV32 RcH, RdH — 32-bit Floating-Point Maximum with Parallel Move.....	71
MINF32 RaH, RbH — 32-bit Floating-Point Minimum.....	72
MINF32 RaH, #16FHi — 32-bit Floating-Point Minimum	73
MINF32 RaH, RbH MOV32 RcH, RdH — 32-bit Floating-Point Minimum with Parallel Move	74
MOV16 mem16, RaH — Move 16-bit Floating-Point Register Contents to Memory.....	75
MOV32 *(0:16bitAddr), loc32 — Move the Contents of loc32 to Memory	76
MOV32 ACC, RaH — Move 32-bit Floating-Point Register Contents to ACC	77
MOV32 loc32, *(0:16bitAddr) — Move 32-bit Value from Memory to loc32	78
MOV32 mem32, RaH — Move 32-bit Floating-Point Register Contents to Memory	79
MOV32 mem32, STF — Move 32-bit STF Register to Memory	81
MOV32 P, RaH — Move 32-bit Floating-Point Register Contents to P	82
MOV32 RaH, ACC — Move the Contents of ACC to a 32-bit Floating-Point Register	83
MOV32 RaH, mem32 {, CNDF} — Conditional 32-bit Move	84
MOV32 RaH, P — Move the Contents of P to a 32-bit Floating-Point Register	86

Table 1-5. Summary of Instructions (continued)

MOV32 RaH, RbH {, CNDF} — Conditional 32-bit Move.....	87
MOV32 RaH, XARn — Move the Contents of XARn to a 32-bit Floating-Point Register	88
MOV32 RaH, XT — Move the Contents of XT to a 32-bit Floating-Point Register	89
MOV32 STF, mem32 — Move 32-bit Value from Memory to the STF Register	90
MOV32 XARn, RaH — Move 32-bit Floating-Point Register Contents to XARn	91
MOV32 XT, RaH — Move 32-bit Floating-Point Register Contents to XT.....	92
MOVD32 RaH, mem32 — Move 32-bit Value from Memory with Data Copy	93
MOVF32 RaH, #32F — Load the 32-bits of a 32-bit Floating-Point Register	94
MOVI32 RaH, #32FHex — Load the 32-bits of a 32-bit Floating-Point Register with the immediate.....	95
MOVIZ RaH, #16FHiHex — Load the Upper 16-bits of a 32-bit Floating-Point Register	96
MOVIZF32 RaH, #16FHi — Load the Upper 16-bits of a 32-bit Floating-Point Register.....	97
MOVST0 FLAG — Load Selected STF Flags into ST0.....	98
MOVXI RaH, #16FLoHex — Move Immediate to the Low 16-bits of a Floating-Point Register.....	99
MPYF32 RaH, RbH, RcH — 32-bit Floating-Point Multiply	100
MPYF32 RaH, #16FHi, RbH — 32-bit Floating-Point Multiply	101
MPYF32 RaH, RbH, #16FHi — 32-bit Floating-Point Multiply	103
MPYF32 RaH, RbH, RcH ADDF32 RdH, ReH, RfH — 32-bit Floating-Point Multiply with Parallel Add.....	105
MPYF32 RdH, ReH, RfH MOV32 RaH, mem32 — 32-bit Floating-Point Multiply with Parallel Move.....	107
MPYF32 RdH, ReH, RfH MOV32 mem32, RaH — 32-bit Floating-Point Multiply with Parallel Move.....	109
MPYF32 RaH, RbH, RcH SUBF32 RdH, ReH, RfH — 32-bit Floating-Point Multiply with Parallel Subtract.....	110
NEGF32 RaH, RbH{, CNDF} — Conditional Negation	111
POP RB — Pop the RB Register from the Stack	112
PUSH RB — Push the RB Register onto the Stack	114
RESTORE — Restore the Floating-Point Registers	115
RPTB label, loc16 — Repeat A Block of Code	117
RPTB label, #RC — Repeat a Block of Code	119
SAVE FLAG, VALUE — Save Register Set to Shadow Registers and Execute SETFLG	121
SETFLG FLAG, VALUE — Set or clear selected floating-point status flags	123
SUBF32 RaH, RbH, RcH — 32-bit Floating-Point Subtraction	124
SUBF32 RaH, #16FHi, RbH — 32-bit Floating Point Subtraction	125
SUBF32 RdH, ReH, RfH MOV32 RaH, mem32 — 32-bit Floating-Point Subtraction with Parallel Move	126
SUBF32 RdH, ReH, RfH MOV32 mem32, RaH — 32-bit Floating-Point Subtraction with Parallel Move	128
SWAPF RaH, RbH{, CNDF} — Conditional Swap.....	130
TESTTF CNDF — Test STF Register Flag Condition	131
UI16TOF32 RaH, mem16 — Convert unsigned 16-bit integer to 32-bit floating-point value.....	132
UI16TOF32 RaH, RbH — Convert unsigned 16-bit integer to 32-bit floating-point value.....	133
UI32TOF32 RaH, mem32 — Convert Unsigned 32-bit Integer to 32-bit Floating-Point Value.....	134
UI32TOF32 RaH, RbH — Convert Unsigned 32-bit Integer to 32-bit Floating-Point Value	135
ZERO RaH — Zero the Floating-Point Register RaH	136
ZEROA — Zero All Floating-Point Registers.....	137

ABSF32 RaH, RbH 32-bit Floating-Point Absolute Value

Operands

RaH	floating-point destination register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1110 0110 1001 0101
MSW: 0000 0000 00bb baaa
```

Description

The absolute value of RbH is loaded into RaH. Only the sign bit of the operand is modified by the ABSF32 instruction.

```
if (RbH < 0) {RaH = -RbH}
else {RaH = RbH}
```

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes	No	No

The STF register flags are modified as follows:

```
NF = 0;
ZF = 0;
if ( RaH[30:23] == 0) ZF = 1;
```

Pipeline

This is a single-cycle instruction.

Example

```
MOVIZF32 R1H, #-2.0      ; R1H = -2.0 (0xC0000000)
ABSF32 R1H, R1H           ; R1H = 2.0 (0x40000000), ZF = NF = 0

MOVIZF32 R0H, #5.0       ; R0H = 5.0 (0x40A00000)
ABSF32 R0H, R0H          ; R0H = 5.0 (0x40A00000), ZF = NF = 0

MOVIZF32 R0H, #0.0       ; R0H = 0.0
ABSF32 R1H, R0H          ; R1H = 0.0 ZF = 1, NF = 0
```

See also

[NEGF32 RaH, RbH{, CNDF}](#)

ADDF32 RaH, #16FHi, RbH 32-bit Floating-Point Addition
Operands

RaH	floating-point destination register (R0H to R7H)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.
RbH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1110 1000 10II IIII
MSW: IIII IIII IIbb baaa
```

Description

Add RbH to the floating-point value represented by the immediate operand. Store the result of the addition in RaH.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

$RaH = RbH + \#16FHi:0$

This instruction can also be written as ADDF32 RaH, RbH, #16FHi.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if ADDF32 generates an underflow condition.
- LVF = 1 if ADDF32 generates an overflow condition.

Pipeline

This is a 2 pipeline-cycle instruction (2p). That is:

```
ADDF32 RaH, #16FHi, RbH ; 2 pipeline cycles (2p)
NOP                     ; 1 cycle delay or non-conflicting instruction
                        ; <-- ADDF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example

```
; Add to R1H the value 2.0 in 32-bit floating-point format
ADDF32 R0H, #2.0, R1H   ; R0H = 2.0 + R1H
NOP                     ; Delay for ADDF32 to complete
                        ; <-- ADDF32 completes, R0H updated
NOP                     ;

; Add to R3H the value -2.5 in 32-bit floating-point format
ADDF32 R2H, #-2.5, R3H  ; R2H = -2.5 + R3H
NOP                     ; Delay for ADDF32 to complete
                        ; <-- ADDF32 completes, R2H updated
NOP                     ;

; Add to R5H the value 0x3FC00000 (1.5)
ADDF32 R5H, #0x3FC0, R5H ; R5H = 1.5 + R5H
NOP                     ; Delay for ADDF32 to complete
                        ; <-- ADDF32 completes, R5H updated
```

NOP ;

ADDF32 RaH, RbH, #16FHi 32-bit Floating-Point Addition

Operands

RaH	floating-point destination register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.

Opcode

```
LSW: 1110 1000 10II IIII
MSW: IIII IIII IIbb baaa
```

Description

Add RbH to the floating-point value represented by the immediate operand. Store the result of the addition in RaH.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

$RaH = RbH + \#16FHi:0$

This instruction can also be written as **ADDF32 RaH, #16FHi, RbH**.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if ADDF32 generates an underflow condition.
- LVF = 1 if ADDF32 generates an overflow condition.

Pipeline

This is a 2 pipeline-cycle instruction (2p). That is:

```
ADDF32 RaH, #16FHi, RbH    ; 2 pipeline cycles (2p)
NOP                        ; 1 cycle delay or non-conflicting instruction
                             ; <-- ADDF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example

```
; Add to R1H the value 2.0 in 32-bit floating-point format
ADDF32 R0H, R1H, #2.0      ; R0H = R1H + 2.0
NOP                        ; Delay for ADDF32 to complete
                             ; <-- ADDF32 completes, R0H updated
NOP                        ;
; Add to R3H the value -2.5 in 32-bit floating-point format
ADDF32 R2H, R3H, #-2.5     ; R2H = R3H + (-2.5)
NOP                        ; Delay for ADDF32 to complete
                             ; <-- ADDF32 completes, R2H updated
NOP                        ;
                             ; Add to R5H the value 0x3FC00000 (1.5)
ADDF32 R5H, R5H, #0x3FC0   ; R5H = R5H + 1.5
NOP                        ; Delay for ADDF32 to complete
                             ; <-- ADDF32 completes, R5H updated
```

NOP

ADDF32 RaH, RbH, RcH 32-bit Floating-Point Addition

Operands

RaH	floating-point destination register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)
RcH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1110 0111 0001 0000
MSW: 0000 000c cbbb baaa
```

Description

Add the contents of RcH to the contents of RbH and load the result into RaH.

$RaH = RbH + RcH$

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if ADDF32 generates an underflow condition.
- LVF = 1 if ADDF32 generates an overflow condition.

Pipeline

This is a 2 pipeline-cycle instruction (2p). That is:

```
ADDF32 RaH, RbH, RcH    ; 2 pipeline cycles (2p)
NOP                      ; 1 cycle delay or non-conflicting instruction
                          ; <-- ADDF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example

Calculate $Y = M1 \times X1 + B1$. This example assumes that M1, X1, B1 and Y are all on the same data page.

```
MOVW    DP, #M1          ; Load the data page
MOV32    R0H, @M1         ; Load R0H with M1
MOV32    R1H, @X1         ; Load R1H with X1
MPYF32   R1H, R1H, R0H    ; Multiply M1*X1
|| MOV32  R0H, @B1        ; and in parallel load R0H with B1
NOP      ; <-- MOV32 complete
          ; <-- MPYF32 complete
ADDF32   R1H, R1H, R0H    ; Add M*X1 to B1 and store in R1H
NOP      ; <-- ADDF32 complete
MOV32    @Y1, R1H        ; Store the result
```

Calculate $Y = A + B$

```
MOVL    XAR4, #A
MOV32    R0H, *XAR4       ; Load R0H with A
MOVL    XAR4, #B
MOV32    R1H, *XAR4       ; Load R1H with B
ADDF32   R0H, R1H, R0H    ; Add A + B R0H=R0H+R1H
MOVL    XAR4, #Y
          ; < -- ADDF32 complete
MOV32    *XAR4, R0H       ; Store the result
```

MPYF32 RaH, RbH, RcH || ADDF32 RdH, ReH, RfH

ADDF32 RdH, ReH, RfH ||MOV32 mem32, RaH 32-bit Floating-Point Addition with Parallel Move
Operands

RdH	floating-point destination register for the ADDF32 (R0H to R7H)
ReH	floating-point source register for the ADDF32 (R0H to R7H)
RfH	floating-point source register for the ADDF32 (R0H to R7H)
mem32	pointer to a 32-bit memory location. This will be the destination of the MOV32.
RaH	floating-point source register for the MOV32 (R0H to R7H)

Opcode

```
LSW: 1110 0000 0001 fffe
MSW: eedd daaa mem32
```

Description

Perform an ADDF32 and a MOV32 in parallel. Add RfH to the contents of ReH and store the result in RdH. In parallel move the contents of RaH to the 32-bit location pointed to by mem32. mem32 addresses memory using any of the direct or indirect addressing modes supported by the C28x CPU.

```
RdH = ReH + RfH,
[mem32] = RaH
```

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if ADDF32 generates an underflow condition.
- LVF = 1 if ADDF32 generates an overflow condition.

Pipeline

ADDF32 is a 2 pipeline-cycle instruction (2p) and MOV32 takes a single cycle. That is:

```
ADDF32 RdH, ReH, RfH    ; 2 pipeline cycles (2p)
|| MOV32 mem32, RaH      ; 1 cycle
                          ; <-- MOV32 completes, mem32 updated
NOP                      ; 1 cycle delay or non-conflicting instruction
                          ; <-- ADDF32 completes, RdH updated
NOP
```

Any instruction in the delay slot must not use RdH as a destination register or use RdH as a source operand.

Example

```
ADDF32 R3H, R6H, R4H      ; (A) R3H = R6H + R4H and R7H = I3
|| MOV32 R7H, *-SP[2]      ;
                          ; <-- R7H vali
SUBF32 R6H, R6H, R4H      ; (B) R6H = R6H - R4H
                          ; <-- ADDF32 (A) completes, R3H valid
SUBF32 R3H, R1H, R7H      ; (C) R3H = R1H - R7H and store R3H (A)
|| MOV32 *+XAR5[2], R3H    ;
                          ; <-- SUBF32 (B) completes, R6H valid
                          ; <-- MOV32 completes, (A) stored
ADDF32 R4H, R7H, R1H      ; R4H = D = R7H + R1H and store R6H (B)
|| MOV32 *+XAR5[6], R6H    ;
                          ; <-- SUBF32 (C) completes, R3H valid
                          ; <-- MOV32 completes, (B) stored
MOV32 *+XAR5[0], R3H      ; store R3H (C)
                          ; <-- MOV32 completes, (C) stored
                          ; <-- ADDF32 (D) completes, R4H valid
MOV32 *+XAR5[4], R4H      ; store R4H (D) ;
```

i <-- MOV32 completes, (D) stored

ADDF32 RdH, ReH, RfH ||MOV32 RaH, mem32 32-bit Floating-Point Addition with Parallel Move
Operands

RdH	floating-point destination register for the ADDF32 (R0H to R7H). RdH cannot be the same register as RaH.
ReH	floating-point source register for the ADDF32 (R0H to R7H)
RfH	floating-point source register for the ADDF32 (R0H to R7H)
RaH	floating-point destination register for the MOV32 (R0H to R7H). RaH cannot be the same register as RdH.
mem32	pointer to a 32-bit memory location. This is the source for the MOV32.

Opcode

```
LSW: 1110 0011 0001 fffe
MSW: eedd daaa mem32
```

Description

Perform an ADDF32 and a MOV32 operation in parallel. Add RfH to the contents of ReH and store the result in RdH. In parallel move the contents of the 32-bit location pointed to by mem32 to RaH. mem32 addresses memory using any of the direct or indirect addressing modes supported by the C28x CPU.

```
RdH = ReH + RfH,
RaH = [mem32]
```

Restrictions

The destination register for the ADDF32 and the MOV32 must be unique. That is, RaH and RdH cannot be the same register.

Any instruction in the delay slot must not use RdH as a destination register or use RdH as a source operand.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	Yes	Yes	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if ADDF32 generates an underflow condition.
- LVF = 1 if ADDF32 generates an overflow condition.

The MOV32 Instruction will set the NF, ZF, NI and ZI flags as follows:

```
NF = RaH(31);
ZF = 0;
if(RaH(30:23) == 0) { ZF = 1; NF = 0; }
NI = RaH(31);
ZI = 0;
if(RaH(31:0) == 0) ZI = 1;
```

Pipeline

The ADDF32 takes 2 pipeline cycles (2p) and the MOV32 takes a single cycle. That is:

```
ADDF32 RdH, ReH, RfH    ; 2 pipeline cycles (2p)
|| MOV32 RaH, mem32      ; 1 cycle
                        ; <-- MOV32 completes, RaH updated NOP
                        ; 1 cycle delay or non-conflicting instruction
                        ; <-- ADDF32 completes, RdH updated

NOP
```

Example

Calculate $Y = A + B - C$:

```

        MOVL XAR4, #A
        MOV32 R0H, *XAR4      ; Load R0H with A
        MOVL XAR4, #B
        MOV32 R1H, *XAR4      ; Load R1H with B
        MOVL XAR4, #C
        ADDF32 R0H,R1H,R0H    ; Add A + B and in parallel
    ||  MOV32 R2H, *XAR4      ; Load R2H with C
        ; <-- MOV32 complete

        MOVL XAR4,#Y
        ; ADDF32 complete

        SUBF32 R0H,R0H,R2H    ; Subtract C from (A + B)
        NOP ;

        ; <-- SUBF32 completes

        MOV32 *XAR4,R0H      ; Store the result

```

CMPF32 RaH, RbH 32-bit Floating-Point Compare for Equal, Less Than or Greater Than
Operands

RaH	floating-point source register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1110 0110 1001 0100
MSW: 0000 0000 00bb baaa
```

Description

Set ZF and NF flags on the result of RaH - RbH. The CMPF32 instruction is performed as a logical compare operation. This is possible because of the IEEE format offsetting the exponent. Basically the bigger the binary number, the bigger the floating-point value.

Special cases for inputs:

- Negative zero will be treated as positive zero.
- A denormalized value will be treated as positive zero.
- Not-a-Number (NaN) will be treated as infinity.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes	No	No

The STF register flags are modified as follows:

```
If(RaH == RbH) {ZF=1, NF=0}
If(RaH > RbH) {ZF=0, NF=0}
If(RaH < RbH) {ZF=0, NF=1}
```

Pipeline

This is a single-cycle instruction.

Example

```
; Behavior of ZF and NF flags for different comparisons

MOVIF32 R0H, #5.0 ; R0H = 5.0 (0x40A00000)
CMPF32 R1H, R0H ; ZF = 0, NF = 1
CMPF32 R0H, R1H ; ZF = 0, NF = 0
CMPF32 R0H, R0H ; ZF = 1, NF = 0

; Using the result of a compare for loop control

Loop:
MOV32 R0H,*XAR4++ ; Load R0H
MOV32 R1H,*XAR3++ ; Load R1H
CMPF32 R1H, R0H ; Set/clear ZF and NF
MOVST0 ZF, NF ; Copy ZF and NF to ST0 Z and N bits
BF Loop, GT ; Loop if R1H > R0H
```

CMPF32 RaH, #16FHi 32-bit Floating-Point Compare for Equal, Less Than or Greater Than

Operands

RaH	floating-point source register (R0H to R7H)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.

Opcode

```
LSW: 1110 1000 0001 0III
MSW: IIII IIII IIII Iaaa
```

Description

Compare the value in RaH with the floating-point value represented by the immediate operand. Set the ZF and NF flags on (RaH - #16FHi:0).

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. This addressing mode is most useful for constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, -1.5 can be represented as #-1.5 or #0xBFC0.

The CMPF32 instruction is performed as a logical compare operation. This is possible because of the IEEE floating-point format offsets the exponent. Basically the bigger the binary number, the bigger the floating-point value.

Special cases for inputs:

- Negative zero will be treated as positive zero.
- Denormalized value will be treated as positive zero.
- Not-a-Number (NaN) will be treated as infinity.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes	No	No

The STF register flags are modified as follows:

```
If(RaH == #16FHi:0) {ZF=1, NF=0}
If(RaH > #16FHi:0) {ZF=0, NF=0}
If(RaH < #16FHi:0) {ZF=0, NF=1}
```

Pipeline

This is a single-cycle instruction

Example

```
; Behavior of ZF and NF flags for different comparisons
MOVIZF32 R1H, #-2.0 ; R1H = -2.0 (0xC0000000)
MOVIZF32 R0H, #5.0 ; R0H = 5.0 (0x40A00000)
CMPF32 R1H, #-2.2 ; ZF = 0, NF = 0
CMPF32 R0H, #6.5 ; ZF = 0, NF = 1
CMPF32 R0H, #5.0 ; ZF = 1, NF = 0
```

```
; Using the result of a compare for loop control
```

```
Loop:
MOV32 R1H,*XAR3++ ; Load R1H
CMPF32 R1H, #2.0 ; Set/clear ZF and NF
MOVST0 ZF, NF ; Copy ZF and NF to ST0 Z and N bits
BF Loop, GT ; Loop if R1H > #2.0
```

CMPF32 RaH, #0.0 32-bit Floating-Point Compare for Equal, Less Than or Greater Than

Operands

RaH	floating-point source register (R0H to R7H)
#0.0	zero

Opcode

LSW: 1110 0101 1010 0aaa

Description

Set the ZF and NF flags on (RaH - #0.0). The CMPF32 instruction is performed as a logical compare operation. This is possible because of the IEEE floating-point format offsets the exponent. Basically the bigger the binary number, the bigger the floating-point value.

Special cases for inputs:

- Negative zero will be treated as positive zero.
- Denormalized value will be treated as positive zero.
- Not-a-Number (NaN) will be treated as infinity.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes	No	No

The STF register flags are modified as follows:

```
If(RaH == #0.0) {ZF=1, NF=0}
If(RaH > #0.0) {ZF=0, NF=0}
If(RaH < #0.0) {ZF=0, NF=1}
```

Pipeline

This is a single-cycle instruction.

Example

```
; Behavior of ZF and NF flags for different comparisons
MOVIZF32 R0H, #5.0 ; R0H = 5.0 (0x40A00000)
MOVIZF32 R1H, #-2.0 ; R1H = -2.0 (0xC0000000)
MOVIZF32 R2H, #0.0 ; R2H = 0.0 (0x00000000)
CMPF32 R0H, #0.0 ; ZF = 0, NF = 0
CMPF32 R1H, #0.0 ; ZF = 0, NF = 1
CMPF32 R2H, #0.0 ; ZF = 1, NF = 0

; Using the result of a compare for loop control

Loop:
MOV32 R1H,*XAR3++ ; Load R1H
CMPF32 R1H, #0.0 ; Set/clear ZF and NF
MOVST0 ZF, NF ; Copy ZF and NF to ST0 Z and N bits
BF Loop, GT ; Loop if R1H > #0.0
```

EINVF32 RaH, RbH 32-bit Floating-Point Reciprocal Approximation
Operands

RaH	floating-point destination register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1110 0110 1001 0011
MSW: 0000 0000 00bb baaa
```

Description

This operation generates an estimate of $1/X$ in 32-bit floating-point format accurate to approximately 8 bits. This value can be used in a Newton-Raphson algorithm to get a more accurate answer. That is:

```
Ye = Estimate(1/X);
Ye = Ye*(2.0 - Ye*X)
Ye = Ye*(2.0 - Ye*X)
```

After two iterations of the Newton-Raphson algorithm, you will get an exact answer accurate to the 32-bit floating-point format. On each iteration the mantissa bit accuracy approximately doubles. The EINVF32 operation will not generate a negative zero, DeNorm or NaN value.

RaH = Estimate of $1/RbH$

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if EINVF32 generates an underflow condition.
- LVF = 1 if EINVF32 generates an overflow condition.

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
EINVF32 RaH, RbH ; 2p
NOP               ; 1 cycle delay or non-conflicting instruction
                  ; <-- EINVF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example

Calculate $Y = A/B$. A fast division routine similar to that shown below can be found in the *C28x FPU Fast RTS Library* ([SPRC664](#)).

```

MOVL  XAR4, #A
MOV32 R0H, *XAR4           ; Load R0H with A
MOVL  XAR4, #B
MOV32 R1H, *XAR4           ; Load R1H with B
LCR   DIV                  ; Calculate R0H = R0H / R1H
MOV32 *XAR4, R0H           ;
....

DIV:
EINVF32  R2H, R1H           ; R2H = Ye = Estimate(1/B)
CMPF32  R0H, #0.0           ; Check if A == 0
MPYF32  R3H, R2H, R1H       ; R3H = Ye*B
NOP
SUBF32  R3H, #2.0, R3H      ; R3H = 2.0 - Ye*B
NOP
MPYF32  R2H, R2H, R3H       ; R2H = Ye = Ye*(2.0 - Ye*B)
NOP
MPYF32  R3H, R2H, R1H       ; R3H = Ye*B
CMPF32  R1H, #0.0           ; Check if B == 0.0
SUBF32  R3H, #2.0, R3H      ; R3H = 2.0 - Ye*B
NEGF32  R0H, R0H, EQ        ; Fixes sign for A/0.0
MPYF32  R2H, R2H, R3H       ; R2H = Ye = Ye*(2.0 - Ye*B)
NOP
MPYF32  R0H, R0H, R2H       ; R0H = Y = A*Ye = A/B
LRETR

```

[EISQRTF32 RaH, RbH](#)

EISQRTF32 RaH, RbH 32-bit Floating-Point Square-Root Reciprocal Approximation
Operands

RaH	floating-point destination register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1110 0110 1001 0010
MSW: 0000 0000 00bb baaa
```

Description

This operation generates an estimate of $1/\sqrt{X}$ in 32-bit floating-point format accurate to approximately 8 bits. This value can be used in a Newton-Raphson algorithm to get a more accurate answer. That is:

```
Ye = Estimate(1/sqrt(X));
Ye = Ye*(1.5 - Ye*Ye*X/2.0)
Ye = Ye*(1.5 - Ye*Ye*X/2.0)
```

After 2 iterations of the Newton-Raphson algorithm, you will get an exact answer accurate to the 32-bit floating-point format. On each iteration the mantissa bit accuracy approximately doubles. The EISQRTF32 operation will not generate a negative zero, DeNorm or NaN value.

```
RaH = Estimate of 1/sqrt (RbH)
```

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if EISQRTF32 generates an underflow condition.
- LVF = 1 if EISQRTF32 generates an overflow condition.

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
EINV F32 RaH, RbH ; 2 pipeline cycles (2p)
NOP                ; 1 cycle delay or non-conflicting instruction
                   ; <-- EISQRTF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example

Calculate the square root of X. A square-root routine similar to that shown below can be found in the *C28x FPU Fast RTS Library* ([SPRC664](#)).

```

; Y = sqrt(X)
; Ye = Estimate(1/sqrt(X));
; Ye = Ye*(1.5 - Ye*Ye*X*0.5)
; Ye = Ye*(1.5 - Ye*Ye*X*0.5)
; Y = X*Ye
_sqrt:
                                ; R0H = X on entry
EISQRTF32  R1H, R0H              ; R1H = Ye = Estimate(1/sqrt(X))
MPYF32     R2H, R0H, #0.5        ; R2H = X*0.5
MPYF32     R3H, R1H, R1H        ; R3H = Ye*Ye
NOP
MPYF32     R3H, R3H, R2H        ; R3H = Ye*Ye*X*0.5
NOP
SUBF32     R3H, #1.5, R3H       ; R3H = 1.5 - Ye*Ye*X*0.5
NOP
MPYF32     R1H, R1H, R3H        ; R2H = Ye = Ye*(1.5 - Ye*Ye*X*0.5)
NOP

F32TOI16 RaH, RbH *Convert 32-bit Floating-Point Value to 16-bit Integer*
Operands

RaH	floating-point destination register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1110 0110 1000 1100
MSW: 0000 0000 00bb baaa
```

Description

Convert a 32-bit floating point value in RbH to a 16-bit integer and truncate. The result will be stored in RaH.

```
RaH(15:0) = F32TOI16(RbH)
RaH(31:16) = sign extension of RaH(15)
```

Flags

This instruction does not affect any flags:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
F32TOI16 RaH, RbH ; 2 pipeline cycles (2p)
NOP                ; 1 cycle delay or non-conflicting instruction
                   ; <-- F32TOI16 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example

```
MOVIZF32 R0H, #5.0 ; R0H = 5.0 (0x40A00000)
F32TOI16 R1H, R0H  ; R1H(15:0) = F32TOI16(R0H)
                   ; R1H(31:16) = Sign extension of R1H(15)
MOVIZF32 R2H, #-5.0 ; R2H = -5.0 (0xC0A00000)
                   ; <-- F32TOI16 complete, R1H(15:0) = 5 (0x0005)
                   ; R1H(31:16) = 0 (0x0000)
F32TOI16 R3H, R2H  ; R3H(15:0) = F32TOI16(R2H)
                   ; R3H(31:16) = Sign extension of R3H(15)
NOP                ; 1 Cycle delay for F32TOI16 to complete
                   ; <-- F32TOI16 complete, R3H(15:0) = -5 (0xFFFF)
                   ; R3H(31:16) = (0xFFFF)
```

F32TOI16R RaH, RbH Convert 32-bit Floating-Point Value to 16-bit Integer and Round

Operands

RaH	floating-point destination register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1110 0110 1000 1100
MSW: 1000 0000 00bb baaa
```

Description

Convert the 32-bit floating point value in RbH to a 16-bit integer and round to the nearest even value. The result is stored in RaH.

```
RaH(15:0) = F32ToI16round(RbH)
RaH(31:16) = sign extension of RaH(15)
```

Flags

This instruction does not affect any flags:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
F32TOI16R RaH, RbH ; 2 pipeline cycles (2p)
NOP                ; 1 cycle delay or non-conflicting instruction
                   ; <-- F32TOI16R completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example

```
MOVIZ R0H, #0x3FD9 ; R0H [31:16] = 0x3FD9
MOVXI R0H, #0x999A ; R0H [15:0] = 0x999A
                   ; R0H = 1.7 (0x3FD9999A)
F32TOI16R R1H, R0H ; R1H(15:0) = F32TOI16round (R0H)
                   ; R1H(31:16) = Sign extension of R1H(15)
MOVF32 R2H, #-1.7 ; R2H = -1.7 (0xBFD9999A)
                   ; <- F32TOI16R complete, R1H(15:0) = 2 (0x0002)
                   ; R1H(31:16) = 0 (0x0000)
F32TOI16R R3H, R2H ; R3H(15:0) = F32TOI16round (R2H)
                   ; R3H(31:16) = Sign extension of R2H(15)
NOP                ; 1 Cycle delay for F32TOI16R to complete
                   ; <-- F32TOI16R complete, R1H(15:0) = -2 (0xFFFFE)
                   ; R1H(31:16) = (0xFFFF)
```

F32TOUI16 RaH, RbH *Convert 32-bit Floating-Point Value to 16-bit Unsigned Integer*

Operands

RaH	floating-point destination register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1110 0110 1000 1110
MSW: 0000 0000 00bb baaa
```

Description

Convert the 32-bit floating point value in RbH to an unsigned 16-bit integer value and truncate to zero. The result will be stored in RaH. To instead round the integer to the nearest even value use the F32TOUI16R instruction.

```
RaH(15:0) = F32ToUI16(RbH) RaH(31:16) = 0x0000
```

Flags

This instruction does not affect any flags:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
F32TOUI16 RaH, RbH ; 2 pipeline cycles (2p)
NOP                ; 1 cycle delay or non-conflicting instruction
                   ; <-- F32TOUI16 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example

```
MOVIZF32 R4H, #9.0      ; R4H = 9.0 (0x41100000)
F32TOUI16 R5H, R4H      ; R5H (15:0) = F32TOUI16 (R4H)
                       ; R5H (31:16) = 0x0000
MOVIZF32 R6H, #-9.0     ; R6H = -9.0 (0xC1100000)
                       ; <-- F32TOUI16 complete, R5H (15:0) = 9.0 (0x0009)
                       ; R5H (31:16) = 0.0 (0x0000)
F32TOUI16 R7H, R6H      ; R7H (15:0) = F32TOUI16 (R6H)
                       ; R7H (31:16) = 0x0000
NOP                     ; 1 Cycle delay for F32TOUI16 to complete
                       ; <-- F32TOUI16 complete, R7H (15:0) = 0.0 (0x0000)

I32TOF32 RaH, mem32 *Convert 32-bit Integer to 32-bit Floating-Point Value*

Operands

RaH	floating-point destination register (R0H to R7H)
mem32	32-bit source for the MOV32 operation. mem32 means that the operation can only address memory using any of the direct or indirect addressing modes supported by the C28x CPU

Opcode

LSW: 1110 0010 1000 1000
MSW: 0000 0aaa mem32

Description

Convert the 32-bit signed integer indicated by the mem32 pointer to a 32-bit floating point value and store the result in RaH.

RaH = I32ToF32[mem32]

Flags

This instruction does not affect any flags:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
I32TOF32 RaH, mem32 ; 2 pipeline cycles (2p)
NOP                  ; 1 cycle delay or non-conflicting instruction
                    ; <-- I32TOF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example

```
MOVW DP, #0x0280 ; DP = 0x0280
MOV  @0, #0x1111 ; [0x00A000] = 4369 (0x1111)
MOV  @1, #0x1111 ; [0x00A001] = 4369 (0x1111)
                    ; Value of the 32 bit signed integer present in
                    ; 0x00A001 and 0x00A000 is +286331153 (0x11111111)
I32TOF32 R1H, @0 ; R1H = I32TOF32 (0x11111111)
NOP              ; 1 Cycle delay for I32TOF32 to complete
                    ; <-- I32TOF32 complete, R1H = 286331153 (0x4D888888)
```

I32TOF32 RaH, RbH *Convert 32-bit Integer to 32-bit Floating-Point Value*
Operands

RaH	floating-point destination register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1110 0110 1000 1001
MSW: 0000 0000 00bb baaa
```

Description

Convert the signed 32-bit integer in RbH to a 32-bit floating-point value and store the result in RaH.

$RaH = I32ToF32(RbH)$

Flags

This instruction does not affect any flags:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
I32TOF32 RaH, RbH ; 2 pipeline cycles (2p)
NOP                ; 1 cycle delay or non-conflicting instruction
                   ; <-- I32TOF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example

```
MOVIZ R2H, #0x1111 ; R2H[31:16] = 4369 (0x1111)
MOVXI R2H, #0x1111 ; R2H[15:0] = 4369 (0x1111)
                   ; Value of the 32 bit signed integer present
                   ; in R2H is +286331153 (0x11111111)
I32TOF32 R3H, R2H ; R3H = I32TOF32 (R2H)
NOP                ; 1 Cycle delay for I32TOF32 to complete
                   ; <-- I32TOF32 complete, R3H = 286331153 (0x4D888888)
```

MACF32 R3H, R2H, RdH, ReH, RfH 32-bit Floating-Point Multiply with Parallel Add

Operands

This instruction is an alias for the parallel multiply and add instruction. The operands are translated by the assembler such that the instruction becomes:

```
MPYF32 RdH, RaH, RbH
|| ADDF32 R3H, R3H, R2H
```

R3H	floating-point destination and source register for the ADDF32
R2H	floating-point source register for the ADDF32 operation (R0H to R7H)
RdH	floating-point destination register for MPYF32 operation (R0H to R7H) RdH cannot be R3H
ReH	floating-point source register for MPYF32 operation (R0H to R7H)
RfH	floating-point source register for MPYF32 operation (R0H to R7H)

Opcode

```
LSW: 1110 0111 0100 00ff
MSW: feee dddc cbbb baaa
```

Description

This instruction is an alias for the parallel multiply and add, MACF32 || ADDF32, instruction.

```
RdH = ReH * RfH
R3H = R3H + R2H
```

Restrictions

The destination register for the MPYF32 and the ADDF32 must be unique. That is, RdH cannot be R3H.

Flags

This instruction modifies the following flags in the STF register:.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 or ADDF32 generates an underflow condition.
- LVF = 1 if MPYF32 or ADDF32 generates an overflow condition.

Pipeline

Both MPYF32 and ADDF32 take 2 pipeline cycles (2p) That is:

```
MPYF32 RaH, RbH, RcH ; 2 pipeline cycles (2p)
|| ADDF32 RdH, ReH, RfH ; 2 pipeline cycles (2p)
NOP ; 1 cycle delay or non-conflicting instruction
; <-- MPYF32, ADDF32 complete, RaH, RdH updated
NOP
```

Any instruction in the delay slot must not use RaH or RdH as a destination register or as a source operand.

Example

```

; Perform 5 multiply and accumulate operations:
;
; 1st multiply: A = X0 * Y0
; 2nd multiply: B = X1 * Y1
; 3rd multiply: C = X2 * Y2
; 4th multiply: D = X3 * Y3
; 5th multiply: E = X3 * Y3
;
; Result = A + B + C + D + E

MOV32 R0H, *XAR4++      ; R0H = X0
MOV32 R1H, *XAR5++      ; R1H = Y0
                        ; R2H = A = X0 * Y0
MPYF32 R2H, R0H, R1H    ; In parallel R0H = X1
| MOV32 R0H, *XAR4++
MOV32 R1H, *XAR5++      ; R1H = Y1
                        ; R3H = B = X1 * Y1
MPYF32 R3H, R0H, R1H    ; In parallel R0H = X2
| MOV32 R0H, *XAR4++
MOV32 R1H, *XAR5++      ; R1H = Y2
                        ; R3H = A + B
                        ; R2H = C = X2 * Y2
MACF32 R3H, R2H, R2H, R0H, R1H ; In parallel R0H = X3
| MOV32 R0H, *XAR4++
MOV32 R1H, *XAR5++      ; R1H = Y3
                        ; R3H = (A + B) + C
                        ; R2H = D = X3 * Y3
MACF32 R3H, R2H, R2H, R0H, R1H ; In parallel R0H = X4
| MOV32 R0H, *XAR4
MOV32 R1H, *XAR5        ; R1H = Y4

; The next MACF32 is an alias for
; MPYF32 || ADDF32
                        ; R2H = E = X4 * Y4
MACF32 R3H, R2H, R2H, R0H, R1H ; in parallel R3H = (A + B + C) + D
NOP                          ; Wait for MPYF32 || ADDF32 to complete

ADDF32 R3H, R3H, R2H      ; R3H = (A + B + C + D) + E
NOP                      ; Wait for ADDF32 to complete
MOV32 @Result, R3H       ; Store the result

```

MACF32 R3H, R2H, RdH, ReH, RfH ||MOV32 RaH, mem32 32-bit Floating-Point Multiply and Accumulate with Parallel Move

Operands

R3H	floating-point destination/source register R3H for the add operation
R2H	floating-point source register R2H for the add operation
RdH	floating-point destination register (R0H to R7H) for the multiply operation RdH cannot be the same register as RaH
ReH	floating-point source register (R0H to R7H) for the multiply operation
RfH	floating-point source register (R0H to R7H) for the multiply operation
RaH	floating-point destination register for the MOV32 operation (R0H to R7H). RaH cannot be R3H or the same register as RdH.
mem32	32-bit source for the MOV32 operation

Opcode

LSW: 1110 0011 0011 fffe
MSW: eedd daaa mem32

Description

Multiply and accumulate the contents of floating-point registers and move from register to memory. The destination register for the MOV32 cannot be the same as the destination registers for the MACF32.

$R3H = R3H + R2H,$
 $RdH = ReH * RfH,$
 $RaH = [mem32]$

Restrictions

The destination registers for the MACF32 and the MOV32 must be unique. That is, RaH cannot be R3H and RaH cannot be the same register as RdH.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	Yes	Yes	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if MACF32 (add or multiply) generates an underflow condition.
- LVF = 1 if MACF32 (add or multiply) generates an overflow condition.

MOV32 sets the NF, ZF, NI and ZI flags as follows:

```
NF = RaH(31);
ZF = 0;
if(RaH(30:23) == 0) { ZF = 1; NF = 0; }
NI = RaH(31);
ZI = 0;
if(RaH(31:0) == 0) ZI = 1;
```

Pipeline

The MACF32 takes 2 pipeline cycles (2p) and the MOV32 takes a single cycle. That is:

```
MACF32 R3H, R2H, RdH, ReH, RfH ; 2 pipeline cycles (2p)
| | MOV32 RaH, mem32             ; 1 cycle
                                   ; <-- MOV32 completes, RaH updated
NOP                               ; 1 cycle delay for MACF32
                                   ; <-- MACF32 completes, R3H, RdH updated
NOP
```

Any instruction in the delay slot for this version of MACF32 must not use R3H or RdH as a destination register or R3H or RdH as a source operand.

Example

```

; Perform 5 multiply and accumulate operations:
;
; 1ST multiply: A = X0 * Y0
; 2nd multiply: B = X1 * Y1
; 3rd multiply: C = X2 * Y2
; 4TH multiply: D = X3 * Y3
; 5th multiply: E = X3 * Y3
;
; Result = A + B + C + D + E

MOV32 R0H, *XAR4++      ; R0H = X0
MOV32 R1H, *XAR5++      ; R1H = Y0

                        ; R2H = A = X0 * Y0
MPYF32 R2H, R0H, R1H    ; In parallel R0H = X1
|| MOV32 R0H, *XAR4++
MOV32 R1H, *XAR5++      ; R1H = Y1

                        ; R3H = B = X1 * Y1
MPYF32 R3H, R0H, R1H    ; In parallel R0H = X2
|| MOV32 R0H, *XAR4++
MOV32 R1H, *XAR5++      ; R1H = Y2

                        ; R3H = A + B
                        ; R2H = C = X2 * Y2
MACF32 R3H, R2H, R2H, R0H, R1H ; In parallel R0H = X3
|| MOV32 R0H, *XAR4++
MOV32 R1H, *XAR5++      ; R1H = Y3

                        ; R3H = (A + B) + C
                        ; R2H = D = X3 * Y3
MACF32 R3H, R2H, R2H, R0H, R1H ; In parallel R0H = X4
|| MOV32 R0H, *XAR4
MOV32 R1H, *XAR5        ; R1H = Y4

                        ; R2H = E = X4 * Y4
MPYF32 R2H, R0H, R1H    ; in parallel R3H = (A + B + C) + D
|| ADDF32 R3H, R3H, R2H
NOP                    ; Wait for MPYF32 || ADDF32 to complete

ADDF32 R3H, R3H, R2H    ; R3H = (A + B + C + D) + E
NOP                    ; Wait for ADDF32 to complete
MOV32 @Result, R3H     ; Store the result

```

MACF32 R7H, R3H, mem32, *XAR7++ 32-bit Floating-Point Multiply and Accumulate

Operands

R7H	floating-point destination register
R3H	floating-point destination register
mem32	pointer to a 32-bit source location
*XAR7++	32-bit location pointed to by auxiliary register 7, XAR7 is post incremented.

Opcode

LSW: 1110 0010 0101 0000
MSW: 00bb baaa mem32

Description

Perform an multiply and accumulate operation. When used as a stand-alone operation, the MACF32 will perform a single multiply as shown below:

Cycle 1: R3H = R3H + R2H, R2H = [mem32] * [XAR7++]

This instruction is the only floating-point instruction that can be repeated using the single repeat instruction (RPT ||). When repeated, the destination of the accumulate will alternate between R3H and R7H on each cycle and R2H and R6H are used as temporary storage for each multiply.

Cycle 1: R3H = R3H + R2H, R2H = [mem32] * [XAR7++]

Cycle 2: R7H = R7H + R6H, R6H = [mem32] * [XAR7++]

Cycle 3: R3H = R3H + R2H, R2H = [mem32] * [XAR7++]

Cycle 4: R7H = R7H + R6H, R6H = [mem32] * [XAR7++]

etc...

Restrictions

R2H and R6H will be used as temporary storage by this instruction.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if MACF32 generates an underflow condition.
- LVF = 1 if MACF32 generates an overflow condition.

Pipeline

When repeated the MACF32 takes 3 + N cycles where N is the number of times the instruction is repeated. When repeated, this instruction has the following pipeline restrictions:

```

<instruction1>           ; No restriction
<instruction2>           ; Cannot be a 2p instruction that writes
                           ; to R2H, R3H, R6H or R7H
RPT #(N-1)               ; Execute N times, where N is even
|| MACF32 R7H, R3H, *XAR6++, *XAR7++
<instruction3>           ; No restrictions.
                           ; Can read R2H, R3H, R6H and R7H

```

MACF32 can also be used standalone. In this case, the instruction takes 2 cycles and the following pipeline restrictions apply:

```
<instruction1>                ; No restriction
<instruction2>                ; Cannot be a 2p instruction that writes
                               ; to R2H, R3H, R6H or R7H
MACF32 R7H, R3H, *XAR6, *XAR7 ; R3H = R3H + R2H, R2H = [mem32] * [XAR7++]
                               ; <--
R2H and R3H are valid (note: no delay required)
NOP
```

Example

```
ZERO R2H                      ; Zero the accumulation registers
ZERO R3H                      ; and temporary multiply storage
registers
ZERO R6H
ZERO R7H
RPT #3                        ; Repeat MACF32 N+1 (4) times
|| MACF32 R7H, R3H, *XAR6++, *XAR7++
ADDF32 R7H, R7H, R3H          ; Final accumulate
NOP                           ; <-- ADDF32 completes, R7H valid
NOP
```

Cascading of RPT || MACF32 is allowed as long as the first and subsequent counts are even. Cascading is useful for creating interruptible windows so that interrupts are not delayed too long by the RPT instruction. For example:

```
ZERO R2H                      ; Zero the accumulation registers
ZERO R3H                      ; and temporary multiply storage
registers
ZERO R6H
ZERO R7H
RPT #3                        ; Execute MACF32 N+1 (4) times
|| MACF32 R7H, R3H, *XAR6++, *XAR7++ RPT #5 ; Execute MACF32 N+1 (6) times
|| MACF32 R7H, R3H, *XAR6++, *XAR7++ RPT #N ; Repeat MACF32 N+1 times where N+1
is even
|| MACF32 R7H, R3H, *XAR6++, *XAR7++
ADDF32 R7H, R7H, R3H          ; Final accumulate
NOP                           ; <-- ADDF32 completes, R7H valid
```

MACF32 R7H, R6H, RdH, ReH, RfH 32-bit Floating-Point Multiply with Parallel Add

Operands This instruction is an alias for the parallel multiply and add instruction. The operands are translated by the assembler such that the instruction becomes:

```
MPYF32 RdH, RaH, RbH || ADDF32 R7H, R7H, R6H
```

R7H	floating-point destination and source register for the ADDF32
R6H	floating-point source register for the ADDF32 operation (R0H to R7H)
RdH	floating-point destination register for MPYF32 operation (R0H to R7H) RdH cannot be R3H
ReH	floating-point source register for MPYF32 operation (R0H to R7H)
RfH	floating-point source register for MPYF32 operation (R0H to R7H)

Opcode LSW: 1110 0111 0100 00ff
MSW: feee dddc cbbb baaa

Description This instruction is an alias for the parallel multiply and add, MACF32 || ADDF32, instruction.

```
RdH = RaH * RbH
R7H = R6H + R6H
```

Restrictions The destination register for the MPYF32 and the ADDF32 must be unique. That is, RdH cannot be R7H.

Flags This instruction modifies the following flags in the STF register:.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 or ADDF32 generates an underflow condition.
- LVF = 1 if MPYF32 or ADDF32 generates an overflow condition.

Pipeline Both MPYF32 and ADDF32 take 2 pipeline cycles (2p) That is:

```
MPYF32 RaH, RbH, R6H ; 2 pipeline cycles (2p)
|| ADDF32 RdH, ReH, RfH ; 2 pipeline cycles (2p)
NOP ; 1 cycle delay or non-conflicting instruction
; <-- MPYF32, ADDF32 complete, RaH, RdH updated
NOP
```

Any instruction in the delay slot must not use RaH or RdH as a destination register or as a source operand.

Example

```

; Perform 5 multiply and accumulate operations:
;
; 1st multiply: A = X0 * Y0
; 2nd multiply: B = X1 * Y1
; 3rd multiply: C = X2 * Y2
; 4th multiply: D = X3 * Y3
; 5th multiply: E = X3 * Y3
;
; Result = A + B + C + D + E

MOV32 R0H, *XAR4++      ; R0H = X0
MOV32 R1H, *XAR5++      ; R1H = Y0
                        ; R6H = A = X0 * Y0
MPYF32 R6H, R0H, R1H    ; In parallel R0H = X1
| MOV32 R0H, *XAR4++
MOV32 R1H, *XAR5++      ; R1H = Y1
                        ; R7H = B = X1 * Y1
MPYF32 R7H, R0H, R1H    ; In parallel R0H = X2
| MOV32 R0H, *XAR4++

MACF32 R7H, R6H, RdH, ReH, RfH ||MOV32 RaH, mem32 32-bit Floating-Point Multiply and Accumulate with Parallel Move

Operands

R7H	floating-point destination/source register R7H for the add operation
R6H	floating-point source register R6H for the add operation
RdH	floating-point destination register (R0H to R7H) for the multiply operation. RdH cannot be the same register as RaH.
ReH	floating-point source register (R0H to R7H) for the multiply operation
RfH	floating-point source register (R0H to R7H) for the multiply operation
RaH	floating-point destination register for the MOV32 operation (R0H to R7H). RaH cannot be R3H or the same as RdH.
mem32	32-bit source for the MOV32 operation

Opcode

LSW: 1110 0011 1100 fffe
MSW: eedd daaa mem32

Description

Multiply/accumulate the contents of floating-point registers and move from register to memory. The destination register for the MOV32 cannot be the same as the destination registers for the MACF32.

$R7H = R7H + R6H$
 $RdH = ReH * RfH,$
 $RaH = [mem32]$

Restrictions

The destination registers for the MACF32 and the MOV32 must be unique. That is, RaH cannot be R7H and RaH cannot be the same register as RdH.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	Yes	Yes	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if MACF32 (add or multiply) generates an underflow condition.
- LVF = 1 if MACF32 (add or multiply) generates an overflow condition.

The MOV32 Instruction will set the NF, ZF, NI and ZI flags as follows:

```
NF = RaH(31);
ZF = 0;
if(RaH(30:23) == 0) {ZF = 1;
NF = 0;} NI = RaH(31);
ZI = 0;
if(RaH(31:0) == 0) ZI = 1;
```

Pipeline

The MACF32 takes 2 pipeline cycles (2p) and the MOV32 takes a single cycle. That is:

```
MACF32 R7H, R6H, RdH, ReH, RfH ; 2 pipeline cycles (2p)
|| MOV32 RaH, mem32 ; 1 cycle
; <-- MOV32 completes, RaH updated
NOP ; 1 cycle delay
; <-- MACF32 completes, R7H, RdH updated
NOP
```

Example

```

Perform 5 multiply and accumulate operations:
;
; 1st multiply: A = X0 * Y0
; 2nd multiply: B = X1 * Y1
; 3rd multiply: C = X2 * Y2
; 4th multiply: D = X3 * Y3
; 5th multiply: E = X3 * Y3
;
; Result = A + B + C + D + E

MOV32 R0H, *XAR4++          ; R0H = X0
MOV32 R1H, *XAR5++          ; R1H = Y0

MAXF32 RaH, RbH 32-bit Floating-Point Maximum

Operands

RaH	floating-point source/destination register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1110 0110 1001 0110
MSW: 0000 0000 00bb baaa
```

Description

```
if (RaH < RbH) RaH = RbH
```

Special cases for the output from the MAXF32 operation:

- NaN output will be converted to infinity
- A denormalized output will be converted to positive zero.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes	No	No

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

```
if (RaH == RbH) {ZF=1, NF=0}
if (RaH > RbH) {ZF=0, NF=0}
if (RaH < RbH) {ZF=0, NF=1}
```

Pipeline

This is a single-cycle instruction.

Example

```
MOVIZF32    R0H, #5.0    ; R0H = 5.0 (0x40A00000)
MOVIZF32    R1H, #-2.0   ; R1H = -2.0 (0xC0000000)
MOVIZF32    R2H, #-1.5   ; R2H = -1.5 (0xBFC00000)
MAXF32      R2H, R1H     ; R2H = -1.5, ZF = NF = 0
MAXF32      R1H, R2H     ; R1H = -1.5, ZF = 0, NF = 1
MAXF32      R2H, R0H     ; R2H = 5.0, ZF = 0, NF = 1
MAXF32      R0H, R2H     ; R2H = 5.0, ZF = 1, NF = 0
```

MAXF32 RaH, #16FHi 32-bit Floating-Point Maximum

Operands

RaH	floating-point source/destination register (R0H to R7H)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.

Opcode

```
LSW: 1110 1000 0010 0III
MSW: IIII IIII IIII Iaaa
```

Description

Compare RaH with the floating-point value represented by the immediate operand. If the immediate value is larger, then load it into RaH.

```
if(RaH < #16FHi:0) RaH = #16FHi:0
```

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. This addressing mode is most useful for constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBF000000). The assembler will accept either a hex or float as the immediate value. That is, -1.5 can be represented as #-1.5 or #0xBF000000.

Special cases for the output from the MAXF32 operation:

- NaN output will be converted to infinity
- A denormalized output will be converted to positive zero.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes	No	No

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

```
if(RaH == #16FHi:0) {ZF=1, NF=0}
if(RaH > #16FHi:0) {ZF=0, NF=0}
if(RaH < #16FHi:0) {ZF=0, NF=1}
```

Pipeline

This is a single-cycle instruction.

Example

```
MOVIZF32    R0H, #5.0    ; R0H = 5.0 (0x40A00000)
MOVIZF32    R1H, #4.0    ; R1H = 4.0 (0x40800000)
MOVIZF32    R2H, #-1.5   ; R2H = -1.5 (0xBF000000)
MAXF32      R0H, #5.5    ; R0H = 5.5, ZF = 0, NF = 1
MAXF32      R1H, #2.5    ; R1H = 4.0, ZF = 0, NF = 0
MAXF32      R2H, #-1.0   ; R2H = -1.0, ZF = 0, NF = 1
MAXF32      R2H, #-1.0   ; R2H = -1.5, ZF = 1, NF = 0
```

[MINF32 RaH, #16FHi](#)

MAXF32 RaH, RbH ||MOV32 RcH, RdH 32-bit Floating-Point Maximum with Parallel Move
Operands

RaH	floating-point source/destination register for the MAXF32 operation (R0H to R7H) RaH cannot be the same register as RcH
RbH	floating-point source register for the MAXF32 operation (R0H to R7H)
RcH	floating-point destination register for the MOV32 operation (R0H to R7H) RcH cannot be the same register as RaH
RdH	floating-point source register for the MOV32 operation (R0H to R7H)

Opcode

```
LSW: 1110 0110 1001 1100
MSW: 0000 dddc cbbb baaa
```

Description

If RaH is less than RbH, then load RaH with RbH. Thus RaH will always have the maximum value. If RaH is less than RbH, then, in parallel, also load RcH with the contents of RdH.

```
if(RaH < RbH) { RaH = RbH; RcH = RdH; }
```

The MAXF32 instruction is performed as a logical compare operation. This is possible because of the IEEE floating-point format offsets the exponent. Basically the bigger the binary number, the bigger the floating-point value.

Special cases for the output from the MAXF32 operation:

- NaN output will be converted to infinity
- A denormalized output will be converted to positive zero.

Restrictions

The destination register for the MAXF32 and the MOV32 must be unique. That is, RaH cannot be the same register as RcH.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes	No	No

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

```
if(RaH == RbH) { ZF=1, NF=0 }
if(RaH > RbH) { ZF=0, NF=0 }
if(RaH < RbH) { ZF=0, NF=1 }
```

Pipeline

This is a single-cycle instruction.

Example

```
MOVIZF32    R0H, #5.0    ; R0H = 5.0 (0x40A00000)
MOVIZF32    R1H, #4.0    ; R1H = 4.0 (0x40800000)
MOVIZF32    R2H, #-1.5   ; R2H = -1.5 (0xBFC00000)
MOVIZF32    R3H, #-2.0   ; R3H = -2.0 (0xC0000000)
MAXF32      R0H, R1H     ; R0H = 5.0, R3H = -1.5, ZF = 0, NF = 0
| | MOV32    R3H, R2H
MAXF32      R1H, R0H     ; R1H = 5.0, R3H = -1.5, ZF = 0, NF = 1
| | MOV32    R3H, R2H
MAXF32      R0H, R1H     ; R0H = 5.0, R2H = -1.5, ZF = 1, NF = 0
| | MOV32    R2H, R1H
```

Opcode

```
LSW: 1110 0110 1001 0111
MSW: 0000 0000 00bb baaa
```

Description

```
if(RaH > RbH) RaH = RbH
```

Special cases for the output from the MINF32 operation:

- NaN output will be converted to infinity
- A denormalized output will be converted to positive zero.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes	No	No

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

```
if(RaH == RbH){ZF=1, NF=0}
if(RaH > RbH) {ZF=0, NF=0}
if(RaH < RbH) {ZF=0, NF=1}
```

Pipeline

This is a single-cycle instruction.

Example

```
MOVIZF32  R0H, #5.0   ; R0H = 5.0 (0x40A00000)
MOVIZF32  R1H, #4.0   ; R1H = 4.0 (0x40800000)
MOVIZF32  R2H, #-1.5  ; R2H = -1.5 (0xBFC00000)
MINF32    R0H, R1H    ; R0H = 4.0, ZF = 0, NF = 0
MINF32    R1H, R2H    ; R1H = -1.5, ZF = 0, NF = 0
MINF32    R2H, R1H    ; R2H = -1.5, ZF = 1, NF = 0
MINF32    R1H, R0H    ; R2H = -1.5, ZF = 0, NF = 1
```

MINF32 RaH, #16FHi 32-bit Floating-Point Minimum

Operands

RaH	floating-point source/destination register (R0H to R7H)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.

Opcode

```
LSW: 1110 1000 0011 0111
MSW: 1111 1111 1111 1aaa
```

Description

Compare RaH with the floating-point value represented by the immediate operand. If the immediate value is smaller, then load it into RaH.

```
if(RaH > #16FHi:0) RaH = #16FHi:0
```

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. This addressing mode is most useful for constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, -1.5 can be represented as #-1.5 or #0xBFC0.

Special cases for the output from the MINF32 operation:

- NaN output will be converted to infinity
- A denormalized output will be converted to positive zero.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes	No	No

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

```
if(RaH == #16FHi:0) {ZF=1, NF=0}
if(RaH > #16FHi:0) {ZF=0, NF=0}
if(RaH < #16FHi:0) {ZF=0, NF=1}
```

Pipeline

This is a single-cycle instruction.

Example

```
MOVIZF32    R0H, #5.0    ; R0H = 5.0 (0x40A00000)
MOVIZF32    R1H, #4.0    ; R1H = 4.0 (0x40800000)
MOVIZF32    R2H, #-1.5   ; R2H = -1.5 (0xBFC00000)
MINF32      R0H, #5.5    ; R0H = 5.0, ZF = 0, NF = 1
MINF32      R1H, #2.5    ; R1H = 2.5, ZF = 0, NF = 0
MINF32      R2H, #-1.0   ; R2H = -1.5, ZF = 0, NF = 1
MINF32      R2H, #-1.5   ; R2H = -1.5, ZF = 1, NF = 0
```

MOV16 mem16, RaH *Move 16-bit Floating-Point Register Contents to Memory*

Operands

mem16	points to the 16-bit destination memory
RaH	floating-point source register (R0H to R7H)

Opcode

LSW: 1110 0010 0001 0011
MSW: 0000 0aaa mem16

Description

Move 16-bit value from the lower 16-bits of the floating-point register (RaH[15:0]) to the location pointed to by mem16.

[mem16] = RaH[15:0]

Flags

No flags STF flags are affected.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This is a single-cycle instruction.

Example

```
MOVW DP,    #0x02C0 ; DP = 0x02C0
MOVXI R4H,  #0x0003 ; R4H = 3.0 (0x0003)
MOV16 @0, R4H      ; [0x00B000] = 3.0 (0x0003)
```

MOV32 *(0:16bitAddr), loc32 *Move the Contents of loc32 to Memory*
Operands

0:16bitAddr	16-bit immediate address, zero extended
loc32	32- bit source location

Opcode

```
LSW: 1011 1101 loc32
MSW: IIII IIII IIII IIII
```

Description

Move the 32-bit value in loc32 to the memory location addressed by 0:16bitAddr. The EALLOW bit in the ST1 register is ignored by this operation.

```
[0:16bitAddr] = [loc32]
```

Flags

This instruction does not modify any STF register flags.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This is a two-cycle instruction.

Example

```
MOVIZ R5H, #0x1234      ; R5H[31:16] = 0x1234
MOVXI R5H, #0xABCD      ; R5H[15:0] = 0xABCD
NOP                     ; 1 Alignment Cycle
MOV32 ACC, R5H           ; ACC = 0x1234ABCD
MOV32 *(0xA000), @ACC    ; [0x00A000] = ACC NOP
                        ; 1 Cycle delay for MOV32 to complete
                        ; <-- MOV32 *(0:16bitAddr), loc32 complete,
                        ; [0x00A000] = 0xABCD, [0x00A001] = 0x1234
```

MOV32 ACC, RaH *Move 32-bit Floating-Point Register Contents to ACC*

Operands

ACC	28x accumulator
RaH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1011 1111 loc32
MSW: IIII IIII IIII IIII
```

Description

If the condition is true, then move the 32-bit value referenced by mem32 to the floating-point register indicated by RaH.

ACC = RaH

Flags

No STF flags are affected.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Z and N flag in status register zero (ST0) of the 28x CPU are affected.

Pipeline

While this is a single-cycle instruction, additional pipeline alignment is required when copying a floating-point register to a C28x register. If the move follows a single cycle floating point instruction, a single alignment cycle must be added. For example:

```
MINF32 R0H,R1H ; Single-cycle instruction
NOP             ; 1 alignment cycle
MOV32 @ACC,R0H ; Copy R0H to ACC
NOP             ; Any instruction
```

If the move follows a 2 pipeline-cycle floating point instruction, then two alignment cycles must be used. For example:

```
ADDF32 R2H, R1H, R0H ; 2 pipeline instruction (2p)
NOP                  ; 1 cycle delay for ADDF32 to complete
                    ; <-- ADDF32 completes, R2H is valid
NOP                  ; 1 alignment cycle MOV32 ACC, R2H
                    ; copy R2H into ACC, takes 2 cycles
                    ; <-- MOV32 completes, ACC is valid
NOP                  ; Any instruction
```

Example

```
ADDF32 R2H, R1H, R0H ; 2 pipeline instruction (2p)
NOP                  ; 1 cycle delay for ADDF32 to complete
                    ; < -- ADDF32 completes, R2H is valid
NOP                  ; 1 alignment cycle
MOV32 ACC, R2H       ; copy R2H into ACC, takes 2 cycles
                    ; <-- MOV32 completes, ACC is valid
NOP                  ; Any instruction
MOVIZF32 R0H, #2.5    ; R0H = 2.5 = 0x40200000
F32TOUI32 R0H, R0H
NOP                  ; Delay for conversion instruction
                    ; < -- Conversion complete, R0H valid
NOP                  ; Alignment cycle
MOV32 P, R0H          ; P = 2 = 0x00000002
```

MOV32 loc32, *(0:16bitAddr) — *Move 32-bit Value from Memory to loc32*

www.ti.com

MOV32 loc32, *(0:16bitAddr) *Move 32-bit Value from Memory to loc32*

Operands

loc32	destination location
0:16bitAddr	16-bit address of the 32-bit source value

Opcode

LSW: 1011 1111 loc32
MSW: IIII IIII IIII IIII

Description

Copy the 32-bit value referenced by 0:16bitAddr to the location indicated by loc32.
[loc32] = [0:16bitAddr]

Flags

No STF flags are affected. If loc32 is the ACC register, then the Z and N flag in status register zero (ST0) of the 28x CPU are affected.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This is a 2 cycle instruction.

Example

```
MOVW DP, #0x0300      ; DP = 0x0300
MOV @0, #0xFFFF      ; [0x00C000] = 0xFFFF;
MOV @1, #0x1111      ; [0x00C001] = 0x1111;
MOV32 @ACC, *(0xC000) ; AL = [0x00C000], AH = [0x00C001]
NOP                   ; 1 Cycle delay for MOV32 to complete
                       ; <-- MOV32 complete, AL = 0xFFFF, AH = 0x1111
```

MOV32 mem32, STF *Move 32-bit STF Register to Memory*

Operands

STF	floating-point status register
mem32	points to the 32-bit destination memory

Opcode

LSW: 1110 0010 0000 0000
MSW: 0000 0000 mem32

Description

Copy the floating-point status register, STF, to memory.

[mem32] = STF

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

No flags affected.

Pipeline

This is a single-cycle instruction.

Example 1

```
MOVW    DP, #0x0280 ; DP = 0x0280
MOVIZF32 R0H, #2.0   ; R0H = 2.0 (0x40000000)
MOVIZF32 R1H, #3.0   ; R1H = 3.0 (0x40400000)
CMPF32  R0H, R1H     ; ZF = 0, NF = 1, STF = 0x00000004
MOV32   @0, STF      ; [0x00A000] = 0x00000004
```

Example 2

```
MOV32   *SP++, STF    ; Store STF in stack
MOVF32  R2H, #3.0     ; R2H = 3.0 (0x40400000)
MOVF32  R3H, #5.0     ; R3H = 5.0 (0x40A00000)
CMPF32  R2H, R3H      ; ZF = 0, NF = 1, STF = 0x00000004
MOV32   R3H, R2H, LT   ; R3H = 3.0 (0x40400000)
MOV32   STF, *--SP    ; Restore STF from stack
```

MOV32 P, RaH *Move 32-bit Floating-Point Register Contents to P*

Operands

P	28x product register P
RaH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1011 1111 loc32
MSW: IIII IIII IIII IIII
```

Description

Move the 32-bit value in RaH to the 28x product register P.

P = RaH

Flags

No flags affected in floating-point unit.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

While this is a single-cycle instruction, additional pipeline alignment is required when copying a floating-point register to a C28x register. If the move follows a single cycle floating point instruction, a single alignment cycle must be added. For example:

```
MINF32 R0H,R1H ; Single-cycle instruction
NOP           ; 1 alignment cycle
MOV32 @ACC,R0H ; Copy R0H to ACC
NOP           ; Any instruction
```

If the move follows a 2 pipeline-cycle floating point instruction, then two alignment cycles must be used. For example:

```
ADDF32 R2H, R1H, R0H ; 2 pipeline instruction (2p)
NOP                 ; 1 cycle delay for ADDF32 to complete
                   ; <-- ADDF32 completes, R2H is valid
NOP                 ; 1 alignment cycle
MOV32 ACC, R2H      ; copy R2H into ACC, takes 1 cycle
                   ; <-- MOV32 completes, ACC is valid
NOP                 ; Any instruction
```

Example

```
MOVIZF32 R0H, #2.5 ; R0H = 2.5 = 0x40200000
F32TOUI32 R0H, R0H
NOP                 ; Delay for conversion instruction
                   ; <-- Conversion complete, R0H valid
NOP                 ; Alignment cycle
MOV32 P, R0H        ; P = 2 = 0x00000002
```

MOV32 RaH, ACC *Move the Contents of ACC to a 32-bit Floating-Point Register*

Operands

RaH	floating-point destination register (R0H to R7H)
ACC	accumulator

Opcode

```
LSW: 1011 1101 10032
MSW: IIII IIII IIII IIII
```

Description

Move the 32-bit value in ACC to the floating-point register RaH.

RaH = ACC

Flags

This instruction does not modify any STF register flags.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

While this is a single-cycle instruction, additional pipeline alignment is required. Four alignment cycles are required after any copy from a standard 28x CPU register to a floating-point register. The four alignment cycles can be filled with any non-conflicting instructions except for the following: FRACF32, UI16TOF32, I16TOF32, F32TOUI32, and F32TOI32.

```
MOV32 R0H,@ACC ; Copy ACC to R0H
NOP             ; Wait 4 cycles
NOP             ; Do not use FRACF32, UI16TOF32
NOP             ; I16TOF32, F32TOUI32 or F32TOI32
NOP             ;
NOP             ; <-- R0H is valid
```

Example

```
MOV AH, #0x0000
MOV AL, #0x0200      ; ACC = 512
MOV32 R0H, ACC
NOP
NOP
NOP
NOP UI32TOF32 R0H, R0H ; R0H = 512.0 (0x44000000)
```

MOV32 RaH, mem32 {, CNDF} *Conditional 32-bit Move*

Operands

RaH	floating-point destination register (R0H to R7H)
mem32	pointer to the 32-bit source memory location
CNDF	optional condition.

Opcode

LSW: 1110 0010 1010 CNDF
MSW: 0000 0aaa mem32

Description

If the condition is true, then move the 32-bit value referenced by mem32 to the floating-point register indicated by RaH.

if (CNDF == TRUE) RaH = [mem32]

CNDF is one of the following conditions:

Encode ⁽¹⁾	CNDF	Description	STF Flags Tested
0000	NEQ	Not equal to zero	ZF == 0
0001	EQ	Equal to zero	ZF == 1
0010	GT	Greater than zero	ZF == 0 AND NF == 0
0011	GEQ	Greater than or equal to zero	NF == 0
0100	LT	Less than zero	NF == 1
0101	LEQ	Less than or equal to zero	ZF == 1 AND NF == 1
1010	TF	Test flag set	TF == 1
1011	NTF	Test flag not set	TF == 0
1100	LU	Latched underflow	LUF == 1
1101	LV	Latched overflow	LVF == 1
1110	UNC	Unconditional	None
1111	UNCF ⁽²⁾	Unconditional with flag modification	None

⁽¹⁾ Values not shown are reserved.

⁽²⁾ This is the default operation if no CNDF field is specified. This condition will allow the ZF, NF, ZI, and NI flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	Yes	Yes	No	No

```
if(CNDF == UNCF)
{
    NF = RaH[31]; ZF = 0;
    if(RaH[30:23] == 0) { ZF = 1; NF = 0; } NI = RaH[31]; ZI = 0;
    if(RaH[31:0] == 0) ZI = 1;
}
else No flags modified;
```

Pipeline

This is a single-cycle instruction.

Example

```
MOVW    DP, #0x0300 ; DP = 0x0300
MOV     @0, #0x5555 ; [0x00C000] = 0x5555
MOV     @1, #0x5555 ; [0x00C001] = 0x5555
MOVIZF32 R3H, #7.0 ; R3H = 7.0 (0x40E00000)
MOVIZF32 R4H, #7.0 ; R4H = 7.0 (0x40E00000)
MAXF32  R3H, R4H ; ZF = 1, NF = 0
MOV32   R1H, @0, EQ ; R1H = 0x55555555
```

```

Description

Move the 32-bit value in the auxiliary register XARn to the floating point register RaH.

RaH = XARn

Flags

This instruction does not modify any STF register flags.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

While this is a single-cycle instruction, additional pipeline alignment is required. Four alignment cycles are required after any copy from a standard 28x CPU register to a floating-point register. The four alignment cycles can be filled with any non-conflicting instructions except for the following: FRACF32, UI16TOF32, I16TOF32, F32TOUI32, and F32TOI32.

```
MOV32 R0H,@XAR7      ; Copy XAR7 to R0H
NOP                   ; Wait 4 alignment cycles
NOP                   ; Do not use FRACF32, UI16TOF32
NOP                   ; I16TOF32, F32TOUI32 or F32TOI32
NOP                   ;
NOP                   ; <-- R0H is valid
ADDF32 R2H,R1H ,R0H  ; Instruction can use R0H as a source
```

Example

```
MOVL XAR1, #0x0200 ; XAR1 = 512
MOV32 R0H, XAR1
NOP
NOP
NOP
NOP
UI32TOF32 R0H, R0H ; R0H = 512.0 (0x44000000)
```

MOV32 RaH, XT *Move the Contents of XT to a 32-bit Floating-Point Register*

Operands

RaH	floating-point register (R0H to R7H)
XT	auxiliary register (XAR0 - XAR7)

Opcode

```
LSW: 1011 1101 loc32
MSW: IIII IIII IIII IIII
```

Description

Move the 32-bit value in temporary register, XT, to the floating-point register RaH.

RaH = XT

Flags

This instruction does not modify any STF register flags.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

While this is a single-cycle instruction, additional pipeline alignment is required. Four alignment cycles are required after any copy from a standard 28x CPU register to a floating-point register. The four alignment cycles can be filled with any non-conflicting instructions except for the following: FRACF32, UI16TOF32, I16TOF32, F32TOUI32, and F32TOI32.

```
MOV32 R0H, XT      ; Copy XT to R0H
NOP                ; Wait 4 alignment cycles
NOP                ; Do not use FRACF32, UI16TOF32
NOP                ; I16TOF32, F32TOUI32 or F32TOI32
NOP                ;
NOP                ; <-- R0H is valid
ADDF32 R2H,R1H,R0H ; Instruction can use R0H as a source

MOV32 STF, mem32 *Move 32-bit Value from Memory to the STF Register*

Operands

STF	floating-point unit status register
mem32	pointer to the 32-bit source memory location

Opcode

```
LSW: 1110 0010 1000 0000
MSW: 0000 0000 mem32
```

Description

Move from memory to the floating-point unit's status register STF.

STF = [mem32]

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	Yes	Yes	Yes	Yes	Yes	Yes	Yes

Restoring status register will overwrite all flags.

Pipeline

This is a single-cycle instruction.

Example 1

```
MOVW DP, #0x0300      ; DP = 0x0300
MOV @2, #0x020C       ; [0x00C002] = 0x020C
MOV @3, #0x0000       ; [0x00C003] = 0x0000
MOV32 STF, @2         ; STF = 0x0000020C
```

Example 2

```
MOV32 *SP++, STF      ; Store STF in stack
MOVF32 R2H, #3.0      ; R2H = 3.0 (0x40400000)
MOVF32 R3H, #5.0      ; R3H = 5.0 (0x40A00000)
CMPF32 R2H, R3H       ; ZF = 0, NF = 1, STF = 0x00000004
MOV32 R3H, R2H, LT    ; R3H = 3.0 (0x40400000)
MOV32 STF, *--SP      ; Restore STF from stack
```

MOV32 XARn, RaH *Move 32-bit Floating-Point Register Contents to XARn*

Operands

XARn	28x auxiliary register (XAR0 - XAR7)
RaH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1011 1111 10c32
MSW: IIII IIII IIII IIII
```

Description

Move the 32-bit value from the floating-point register RaH to the auxiliary register XARn.

XARn = RaH

Flags

No flags affected in floating-point unit.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

While this is a single-cycle instruction, additional pipeline alignment is required when copying a floating-point register to a C28x register. If the move follows a single cycle floating point instruction, a single alignment cycle must be added. For example:

```
MINF32 R0H,R1H      ; Single-cycle instruction
NOP                  ; 1 alignment cycle
MOV32 @ACC,R0H       ; Copy R0H to ACC
NOP                  ; Any instruction
```

If the move follows a 2 pipeline-cycle floating point instruction, then two alignment cycles must be used. For example:

```
ADDF32 R2H, R1H, R0H ; 2 pipeline instruction (2p)
NOP                  ; 1 cycle delay for ADDF32 to complete
                     ; <-- ADDF32 completes, R2H is valid
NOP                  ; 1 alignment cycle
MOV32 ACC, R2H       ; copy R2H into ACC, takes 1 cycle
                     ; <-- MOV32 completes, ACC is valid
NOP                  ; Any instruction
```

Example

```
MOVIZF32 R0H, #2.5   ; R0H = 2.5 = 0x40200000
F32TOUI32 R0H, R0H
NOP                  ; Delay for conversion instruction
                     ; <-- Conversion complete, R0H valid
NOP                  ; Alignment cycle
MOV32 XAR0, R0H       ; XAR0 = 2 = 0x00000002
```

MOV32 XT, RaH *Move 32-bit Floating-Point Register Contents to XT*

Operands

XT	temporary register
RaH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1011 1111 loc32
MSW: IIII IIII IIII IIII
```

Description

Move the 32-bit value in RaH to the temporary register XT.

XT = RaH

Flags

No flags affected in floating-point unit.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

While this is a single-cycle instruction, additional pipeline alignment is required when copying a floating-point register to a C28x register. If the move follows a single cycle floating point instruction, a single alignment cycle must be added. For example:

```
MINF32 R0H,R1H      ; Single-cycle instruction
NOP                 ; 1 alignment cycle
MOV32 @XT,R0H        ; Copy R0H to ACC
NOP                 ; Any instruction
```

If the move follows a 2 pipeline-cycle floating point instruction, then two alignment cycles must be used. For example:

```
ADDF32 R2H, R1H, R0H ; 2 pipeline instruction (2p)
NOP                 ; 1 cycle delay for ADDF32 to complete
                     ; <-- ADDF32 completes, R2H is valid
NOP                 ; 1 alignment cycle
MOV32 XT, R2H       ; copy R2H into ACC, takes 1 cycle
                     ; <-- MOV32 completes, ACC is valid
NOP                 ; Any instruction
```

Example

```
MOVIZF32 R0H, #2.5   ; R0H = 2.5 = 0x40200000
F32TOUI32 R0H, R0H
NOP                 ; Delay for conversion instruction
                     ; <-- Conversion complete, R0H valid
NOP                 ; Alignment cycle
MOV32      XT, R0H    ; XT = 2 = 0x00000002
```

MOVD32 RaH, mem32 *Move 32-bit Value from Memory with Data Copy*

Operands

RaH	floating-point register (R0H to R7H)
mem32	pointer to the 32-bit source memory location

Opcode

```
LSW: 1110 0010 0010 0011
MSW: 0000 0aaa mem32
```

Description

Move the 32-bit value referenced by mem32 to the floating-point register indicated by RaH.

```
RaH = [mem32] [mem32+2] = [mem32]
```

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	Yes	Yes	No	No

```
NF = RaH[31];
ZF = 0;
if(RaH[30:23] == 0){ ZF = 1; NF = 0; }
NI = RaH[31];
ZI = 0;
if(RaH[31:0] == 0) ZI = 1;
```

Pipeline

This is a single-cycle instruction.

Example

```
MOVW DP, #0x02C0 ; DP = 0x02C0
MOV @2, #0x0000 ; [0x00B002] = 0x0000
MOV @3, #0x4110 ; [0x00B003] = 0x4110
MOVD32 R7H, @2 ; R7H = 0x41100000,
; [0x00B004] = 0x0000, [0x00B005] = 0x4110
```

See also

[MOV32 RaH, mem32 {,CNDF}](#)

MOV32 RaH, #32F Load the 32-bits of a 32-bit Floating-Point Register

Operands

This instruction is an alias for MOVIZ and MOVXI instructions. The second operand is translated by the assembler such that the instruction becomes:

```
MOVIZ RaH, #16FHiHex
MOVXI RaH, #16FLoHex
```

RaH	floating-point destination register (R0H to R7H)
#32F	immediate float value represented in floating-point representation

Opcode

```
LSW: 1110 1000 0000 0III (opcode of MOVIZ RaH, #16FHiHex)
MSW: IIII IIII IIII Iaaa

LSW: 1110 1000 0000 1III (opcode of MOVXI RaH, #16FLoHex)
MSW: IIII IIII IIII Iaaa
```

Description

Note: This instruction accepts the immediate operand only in floating-point representation. To specify the immediate value as a hex value (IEEE 32-bit floating-point format) use the MOV32 RaH, #32FHex instruction.

Load the 32-bits of RaH with the immediate float value represented by #32F.

#32F is a float value represented in floating-point representation. The assembler will only accept a float value represented in floating-point representation. That is, 3.0 can only be represented as #3.0. #0x40400000 will result in an error.

RaH = #32F

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

Depending on #32FH, this instruction takes one or two cycles. If all of the lower 16-bits of the IEEE 32-bit floating-point format of #32F are zeros, then the assembler will convert MOV32 into only MOVIZ instruction. If the lower 16-bits of the IEEE 32-bit floating-point format of #32F are not zeros, then the assembler will convert MOV32 into MOVIZ and MOVXI instructions.

Example

```
MOV32 R1H, #3.0      ; R1H = 3.0 (0x40400000)
                      ; Assembler converts this instruction as
                      ; MOVIZ R1H, #0x4040
MOV32 R2H, #0.0      ; R2H = 0.0 (0x00000000)
                      ; Assembler converts this instruction as
                      ; MOVIZ R2H, #0x0
MOV32 R3H, #12.265   ; R3H = 12.625 (0x41443D71)
                      ; Assembler converts this instruction as
                      ; MOVIZ R3H, #0x4144
                      ; MOVXI R3H, #0x3D71
```

MOVI32 RaH, #32FHex Load the 32-bits of a 32-bit Floating-Point Register with the immediate

Operands

This instruction is an alias for MOVIZ and MOVXI instructions. The second operand is translated by the assembler such that the instruction becomes:

```
MOVIZ RaH, #16FHiHex
MOVXI RaH, #16FLoHex
```

RaH	floating-point register (R0H to R7H)
#32FHex	A 32-bit immediate value that represents an IEEE 32-bit floating-point value.

Opcode

```
LSW: 1110 1000 0000 0III (opcode of MOVIZ RaH, #16FHiHex)
MSW: IIII IIII IIII Iaaa
```

```
LSW: 1110 1000 0000 1III (opcode of MOVXI RaH, #16FLoHex)
MSW: IIII IIII IIII Iaaa
```

Description

Note: This instruction only accepts a hex value as the immediate operand. To specify the immediate value with a floating-point representation use the MOVF32 RaH, #32F instruction.

Load the 32-bits of RaH with the immediate 32-bit hex value represented by #32Fhex.

#32Fhex is a 32-bit immediate hex value that represents the IEEE 32-bit floating-point value of a floating-point number. The assembler will only accept a hex immediate value. That is, 3.0 can only be represented as #0x40400000. #3.0 will result in an error.

RaH = #32FHex

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

Depending on #32FHex, this instruction takes one or two cycles. If all of the lower 16-bits of #32FHex are zeros, then assembler will convert MOVI32 to the MOVIZ instruction. If the lower 16-bits of #32FHex are not zeros, then assembler will convert MOVI32 to a MOVIZ and a MOVXI instruction.

Example

```
MOVI32 R1H, #0x40400000 ; R1H = 0x40400000
                        ; Assembler converts this instruction as
                        ; MOVIZ R1H, #0x4040
MOVI32 R2H, #0x00000000 ; R2H = 0x00000000
                        ; Assembler converts this instruction as
                        ; MOVIZ R2H, #0x0
MOVI32 R3H, #0x40004001 ; R3H = 0x40004001
                        ; Assembler converts this instruction as
                        ; MOVIZ R3H, #0x4000 ; MOVXI R3H, #0x4001
MOVI32 R4H, #0x00004040 ; R4H = 0x00004040
                        ; Assembler converts this instruction as
                        ; MOVIZ R4H, #0x0000 ; MOVXI R4H, #0x4040
```

MOVIZ RaH, #16FHiHex *Load the Upper 16-bits of a 32-bit Floating-Point Register*

Operands

RaH	floating-point register (R0H to R7H)
#16FHiHex	A 16-bit immediate hex value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.

Opcode

```
LSW: 1110 1000 0000 0III
MSW: IIII IIII IIII Iaaa
```

Description

Note: This instruction only accepts a hex value as the immediate operand. To specify the immediate value with a floating-point representation use the MOVIZF32 pseudo instruction.

Load the upper 16-bits of RaH with the immediate value #16FHiHex and clear the low 16-bits of RaH.

#16FHiHex is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. The assembler will only accept a hex immediate value. That is, -1.5 can only be represented as #0xBFC0. #-1.5 will result in an error.

By itself, MOVIZ is useful for loading a floating-point register with a constant in which the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). If a constant requires all 32-bits of a floating-point register to be initialized, then use MOVIZ along with the MOVXI instruction.

```
RaH[31:16] = #16FHiHex
RaH[15:0] = 0
```

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This is a single-cycle instruction.

Example

```
; Load R0H with -1.5 (0xBFC00000)
MOVIZ R0H, #0xBFC0 ; R0H = 0xBFC00000

; Load R0H with pi = 3.141593 (0x40490FDB)
MOVIZ R0H, #0x4049 ; R0H = 0x40490000
MOVXI R0H, #0x0FDB ; R0H = 0x40490FDB
```

See also

[MOVIZF32 RaH, #16FHi](#)
[MOVXI RaH, #16FLoHex](#)

MOVIZF32 RaH, #16FHi *Load the Upper 16-bits of a 32-bit Floating-Point Register*

Operands

RaH	floating-point register (R0H to R7H)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.

Opcode

```
LSW: 1110 1000 0000 0III
MSW: IIII IIII IIII Iaaa
```

Description

Load the upper 16-bits of RaH with the value represented by #16FHi and clear the low 16-bits of RaH.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. This addressing mode is most useful for constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). #16FHi can be specified in hex or float. That is, -1.5 can be represented as #-1.5 or #0xBFC0.

MOVIZF32 is an alias for the MOVIZ RaH, #16FHiHex instruction. In the case of MOVIZF32 the assembler will accept either a hex or float as the immediate value and encodes it into a MOVIZ instruction. For example, MOVIZF32 RaH, #-1.5 will be encoded as MOVIZ RaH, 0xBFC0.

```
RaH[31:16] = #16FHi
RaH[15:0] = 0
```

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This is a single-cycle instruction.

Example

```
MOVIZF32 R0H, #3.0      ; R0H = 3.0 = 0x40400000
MOVIZF32 R1H, #1.0      ; R1H = 1.0 = 0x3F800000
MOVIZF32 R2H, #2.5      ; R2H = 2.5 = 0x40200000
MOVIZF32 R3H, #-5.5     ; R3H = -5.5 = 0xC0B00000
MOVIZF32 R4H, #0xC0B0    ; R4H = -5.5 = 0xC0B00000
;
; Load R5H with pi = 3.141593 (0x40490000)
;
MOVIZF32 R5H, #3.141593 ; R5H = 3.140625 (0x40490000)
;
; Load R0H with a more accurate pi = 3.141593 (0x40490FDB)
;
MOVIZF32 R0H, #0x4049    ; R0H = 0x40490000
MOVXI R0H, #0x0FDB      ; R0H = 0x40490FDB
```

MOVST0 FLAG *Load Selected STF Flags into ST0*

Operands

FLAG	Selected flag
------	---------------

Opcode

LSW: 1010 1101 FFFF FFFF

Description

Load selected flags from the STF register into the ST0 register of the 28x CPU where FLAG is one or more of TF, CI, ZI, ZF, NI, NF, LUF or LVF. The specified flag maps to the ST0 register as follows:

- Set OV = 1 if LVF or LUF is set. Otherwise clear OV.
- Set N = 1 if NF or NI is set. Otherwise clear N.
- Set Z = 1 if ZF or ZI is set. Otherwise clear Z.
- Set C = 1 if TF is set. Otherwise clear C.
- Set TC = 1 if TF is set. Otherwise clear TF.

If any STF flag is not specified, then the corresponding ST0 register bit is not modified.

Restrictions

Do not use the MOVST0 instruction in the delay slots for pipelined operations. Doing so can yield invalid results. To avoid this, the proper number of NOPs or non-pipelined instructions must be inserted before the MOVST0 operation.

```
; The following is INVALID
MPYF32 R2H, R1H, R0H      ; 2 pipeline-cycle instruction (2p)
MOVST0 TF                  ; INVALID, do not use MOVST0 in a delay slot

; The following is VALID
MPYF32 R2H, R1H, R0H      ; 2 pipeline-cycle instruction (2p)
NOP                        ; 1 delay cycle, R2H updated after this instruction
MOVST0 TF                  ; VALID
```

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

When the flags are moved to the C28x ST0 register, the LUF or LVF flags are automatically cleared if selected.

Pipeline

This is a single-cycle instruction.

Example

Program flow is controlled by C28x instructions that read status flags in the status register 0 (ST0). If a decision needs to be made based on a floating-point operation, the information in the STF register needs to be loaded into ST0 flags (Z,N,OV,TC,C) so that the appropriate branch conditional instruction can be executed. The MOVST0 FLAG instruction is used to load the current value of specified STF flags into the respective bits of ST0. When this instruction executes, it will also clear the latched overflow and underflow flags if those flags are specified.

```
Loop:
MOV32 R0H, *XAR4++
MOV32 R1H, *XAR3++
CMPF32 R1H, R0H
MOVST0 ZF, NF
BF Loop, GT      ; Loop if (R1H > R0H)
```

MOVXI RaH, #16FLoHex *Move Immediate to the Low 16-bits of a Floating-Point Register*

Operands

Ra	floating-point register (R0H to R7H)
#16FLoHex	A 16-bit immediate hex value that represents the lower 16-bits of an IEEE 32-bit floating-point value. The upper 16-bits will not be modified.

Opcode

LSW: 1110 1000 0000 1III MSW: IIII IIII IIII Iaaa

Description

Load the low 16-bits of RaH with the immediate value #16FLoHex. #16FLoHex represents the lower 16-bits of an IEEE 32-bit floating-point value. The upper 16-bits of RaH will not be modified. MOVXI can be combined with the MOVIZ or MOVIZF32 instruction to initialize all 32-bits of a RaH register.

RaH[15:0] = #16FLoHex
RaH[31:16] = Unchanged

Flags

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This is a single-cycle instruction.

Example

```
; Load R0H with pi = 3.141593 (0x40490FDB)
MOVIZ R0H,#0x4049 ; R0H = 0x40490000
MOVXI R0H,#0x0FDB ; R0H = 0x40490FDB
```

MPYF32 RaH, RbH, RcH 32-bit Floating-Point Multiply

Operands

RaH	floating-point destination register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)
RcH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1110 0111 0000 0000
MSW: 0000 000c ccbb baaa
```

Description

Multiply the contents of two floating-point registers.

$RaH = RbH * RcH$

Flags

This instruction modifies the following flags in the STF register:.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 generates an underflow condition.
- LVF = 1 if MPYF32 generates an overflow condition.

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
MPYF32 RaH, RbH, RcH ; 2 pipeline cycles (2p)
NOP                   ; 1 cycle delay or non-conflicting instruction
                       ; <-- MPYF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example

Calculate $Y = A * B$:

```
MOVL XAR4, #A
MOV32 R0H, *XAR4 ; Load R0H with A
MOVL XAR4, #B
MOV32 R1H, *XAR4 ; Load R1H with B
MPYF32 R0H,R1H,R0H ; Multiply A * B
MOVL XAR4, #Y
                       ; <--MPYF32 complete
MOV32 *XAR4,R0H      ; Save the result
```

MPYF32 RaH, #16FHi, RbH 32-bit Floating-Point Multiply

Operands

RaH	floating-point destination register (R0H to R7H)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.
RcH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1110 1000 01II IIII
MSW: IIII IIII IIbb baaa
```

Description

Multiply RbH with the floating-point value represented by the immediate operand. Store the result of the addition in RaH.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

RaH = RbH * #16FHi:0

This instruction can also be written as MPYF32 RaH, RbH, #16FHi.

Flags

This instruction modifies the following flags in the STF register:.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 generates an underflow condition.
- LVF = 1 if MPYF32 generates an overflow condition.

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
MPYF32 RaH, #16FHi, RbH ; 2 pipeline cycles (2p)
NOP                      ; 1 cycle delay or non-conflicting instruction
                          ; <-- MPYF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example 1

```
MOVIZF32 R3H, #2.0      ; R3H = 2.0 (0x40000000)
MPYF32 R4H, #3.0, R3H   ; R4H = 3.0 * R3H
MOVL XAR1, #0xB006      ; <-- Non conflicting instruction
                          ; <-- MPYF32 complete, R4H = 6.0 (0x40C00000)
MOV32 *XAR1, R4H        ; Save the result in memory location 0xB006
```

Example 2

```
;Same as above example but #16FHi is represented in Hex
MOVIZF32 R3H, #2.0      ; R3H = 2.0 (0x40000000)
MPYF32 R4H, #0x4040, R3H ; R4H = 0x4040 * R3H
                          ; 3.0 is represented as 0x40400000 in
                          ; IEEE 754 32-bit format
MOVL XAR1, #0xB006      ; <-- Non conflicting instruction
                          ; <-- MPYF32 complete, R4H = 6.0 (0x40C00000)
MOV32 *XAR1, R4H        ; Save the result in memory location 0xB006
```

MPYF32 RaH, RbH, #16FHi 32-bit Floating-Point Multiply

Operands

RaH	floating-point destination register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.

Opcode

```
LSW: 1110 1000 01II IIII
MSW: IIII IIII IIbb baaa
```

Description

Multiply RbH with the floating-point value represented by the immediate operand. Store the result of the addition in RaH.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

$RaH = RbH * \#16FHi:0$

This instruction can also be written as MPYF32 RaH, #16FHi, RbH.

Flags

This instruction modifies the following flags in the STF register:.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 generates an underflow condition.
- LVF = 1 if MPYF32 generates an overflow condition.

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
MPYF32 RaH, RbH, #16FHi    ; 2 pipeline cycles (2p)
NOP                          ; 1 cycle delay or non-conflicting instruction
                             ; <-- MPYF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example 1

```
MOVIZF32 R3H, #2.0          ; R3H = 2.0 (0x40000000)
MPYF32   R4H, R3H, #3.0      ; R4H = R3H * 3.0
MOVL     XAR1, #0xB008        ; <-- Non conflicting instruction
                             ; <-- MPYF32 complete, R4H = 6.0 (0x40C00000)
MOV32    *XAR1, R4H          ; Save the result in memory location 0xB008
```

Example 2

```
;Same as above example but #16FHi is represented in Hex
MOVIZF32 R3H, #2.0          ; R3H = 2.0 (0x40000000)
MPYF32   R4H, R3H, #0x4040  ; R4H = R3H * 0x4040
                             ; 3.0 is represented as 0x40400000 in
                             ; IEEE 754 32-bit format
MOVL     XAR1, #0xB008        ; <-- Non conflicting instruction
                             ; <-- MPYF32 complete, R4H = 6.0 (0x40C00000)
MOV32    *XAR1, R4H          ; Save the result in memory location 0xB008
```

[MPYF32 RaH, RbH, RcH](#)

MPYF32 RaH, RbH, RcH ||ADDF32 RdH, ReH, RfH 32-bit Floating-Point Multiply with Parallel Add
Operands

RaH	floating-point destination register for MPYF32 (R0H to R7H) RaH cannot be the same register as RdH
RbH	floating-point source register for MPYF32 (R0H to R7H)
RcH	floating-point source register for MPYF32 (R0H to R7H)
RdH	floating-point destination register for ADDF32 (R0H to R7H) RdH cannot be the same register as RaH
ReH	floating-point source register for ADDF32 (R0H to R7H)
RfH	floating-point source register for ADDF32 (R0H to R7H)

Opcode

```
LSW: 1110 0111 0100 00ff
MSW: feee dddc cbbb baaa
```

Description

Multiply the contents of two floating-point registers with parallel addition of two registers.

```
RaH = RbH * RcH
RdH = ReH + RfH
```

This instruction can also be written as:

```
MACF32 RaH, RbH, RcH, RdH, ReH, RfH
```

Restrictions

The destination register for the MPYF32 and the ADDF32 must be unique. That is, RaH cannot be the same register as RdH.

Flags

This instruction modifies the following flags in the STF register:.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 or ADDF32 generates an underflow condition.
- LVF = 1 if MPYF32 or ADDF32 generates an overflow condition.

Pipeline

Both MPYF32 and ADDF32 take 2 pipeline cycles (2p) That is:

```
MPYF32 RaH, RbH, RcH ; 2 pipeline cycles (2p)
|| ADDF32 RdH, ReH, RfH ; 2 pipeline cycles (2p)
NOP                      ; 1 cycle delay or non-conflicting instruction
                          ; <-- MPYF32, ADDF32 complete, RaH, RdH updated
NOP
```

Any instruction in the delay slot must not use RaH or RdH as a destination register or as a source operand.

Example

```

; Perform 5 multiply and accumulate operations:
;
; 1st multiply: A = X0 * Y0
; 2nd multiply: B = X1 * Y1
; 3rd multiply: C = X2 * Y2
; 4th multiply: D = X3 * Y3
; 5th multiply: E = X3 * Y3
;
; Result = A + B + C + D + E

MPYF32 RdH, ReH, RfH ||MOV32 RaH, mem32 32-bit Floating-Point Multiply with Parallel Move

Operands

RdH	floating-point destination register for the MPYF32 (R0H to R7H) RdH cannot be the same register as RaH
ReH	floating-point source register for the MPYF32 (R0H to R7H)
RfH	floating-point source register for the MPYF32 (R0H to R7H)
RaH	floating-point destination register for the MOV32 (R0H to R7H) RaH cannot be the same register as RdH
mem32	pointer to a 32-bit memory location. This will be the source of the MOV32.

Opcode

```
LSW: 1110 0011 0000 fffe
MSW: eedd daaa mem32
```

Description

Multiply the contents of two floating-point registers and load another.

```
RdH = ReH * RfH
RaH = [mem32]
```

Restrictions

The destination register for the MPYF32 and the MOV32 must be unique. That is, RaH cannot be the same register as RdH.

Flags

This instruction modifies the following flags in the STF register:.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	Yes	Yes	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 generates an underflow condition.
- LVF = 1 if MPYF32 generates an overflow condition.

The MOV32 Instruction will set the NF, ZF, NI and ZI flags as follows:

```
NF = RaH(31);
ZF = 0;
if(RaH(30:23) == 0) { ZF = 1; NF = 0; }
NI = RaH(31);
ZI = 0;
if(RaH(31:0) == 0) ZI = 1;
```

Pipeline

MPYF32 takes 2 pipeline-cycles (2p) and MOV32 takes a single cycle. That is:

```
MPYF32 RdH, ReH, RfH ; 2 pipeline cycles (2p)
|| MOV32 RaH, mem32 ; 1 cycle
; <-- MOV32 completes, RaH updated
NOP ; 1 cycle delay or non-conflicting instruction
; <-- MPYF32 completes, RdH updated
NOP
```

Any instruction in the delay slot must not use RdH as a destination register or as a source operand.

Example

Calculate $Y = M1 \times X1 + B1$. This example assumes that M1, X1, B1 and Y1 are all on the same data page.

```

MOVW DP, #M1      ; Load the data page
MOV32 R0H,@M1     ; Load R0H with M1
MOV32 R1H,@X1     ; Load R1H with X1
MPYF32 R1H,R1H,R0H ; Multiply M1*X1
|| MOV32 R0H,@B1   ; and in parallel load R0H with B1
                  ; <-- MOV32 complete
NOP               ; Wait 1 cycle for MPYF32 to complete
                  ; <-- MPYF32 complete
ADDF32 R1H,R1H,R0H ; Add M*X1 to B1 and store in R1H
NOP               ; Wait 1 cycle for ADDF32 to complete
                  ; <-- ADDF32 complete
MOV32 @Y1,R1H     ; Store the result

```

Calculate $Y = (A * B) * C$:

```

MOVL XAR4, #A
MOV32 R0H, *XAR4   ; Load R0H with A
MOVL XAR4, #B
MOV32 R1H, *XAR4   ; Load R1H with B
MOVL XAR4, #C
MPYF32 R1H,R1H,R0H ; Calculate R1H = A * B
|| MOV32 R0H, *XAR4 ; and in parallel load R2H with C
                  ; <-- MOV32 complete
MOVL XAR4, #Y
                  ; <-- MPYF32 complete
MPYF32 R2H,R1H,R0H ; Calculate Y = (A * B) * C
NOP               ; Wait 1 cycle for MPYF32 to complete
                  ; MPYF32 complete
MOV32 *XAR4,R2H

```

MPYF32 RdH, ReH, RfH ||MOV32 mem32, RaH 32-bit Floating-Point Multiply with Parallel Move

Operands

RdH	floating-point destination register for the MPYF32 (R0H to R7H)
ReH	floating-point source register for the MPYF32 (R0H to R7H)
RfH	floating-point source register for the MPYF32 (R0H to R7H)
mem32	pointer to a 32-bit memory location. This will be the destination of the MOV32.
RaH	floating-point source register for the MOV32 (R0H to R7H)

Opcode

LSW: 1110 0000 0000 fffe
MSW: eedd daaa mem32

Description

Multiply the contents of two floating-point registers and move from memory to register.

$RdH = ReH * RfH$, $[mem32] = RaH$

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 generates an underflow condition.
- LVF = 1 if MPYF32 generates an overflow condition.

Pipeline

MPYF32 takes 2 pipeline-cycles (2p) and MOV32 takes a single cycle. That is:

```

MPYF32 RdH, ReH, RfH ; 2 pipeline cycles (2p)
| | MOV32 mem32, RaH ; 1 cycle
; <-- MOV32 completes, mem32 updated
NOP ; 1 cycle delay or non-conflicting instruction
; <-- MPYF32 completes, RdH updated
NOP
```

Any instruction in the delay slot must not use RdH as a destination register or as a source operand.

Example

```

MOVL XAR1, #0xC003 ; XAR1 = 0xC003
MOVIZF32 R3H, #2.0 ; R3H = 2.0 (0x40000000)
MPYF32 R3H, R3H, #5.0 ; R3H = R3H * 5.0
MOVIZF32 R1H, #5.0 ; R1H = 5.0 (0x40A00000)
; <-- MPYF32 complete, R3H = 10.0 (0x41200000)
MPYF32 R3H, R1H, R3H ; R3H = R1H * R3H
| | MOV32 *XAR1, R3H ; and in parallel store previous R3 value
; MOV32 complete, [0xC003] = 0x4120,
; [0xC002] = 0x0000
NOP ; 1 cycle delay for MPYF32 to complete
; <-- MPYF32 , R3H = 50.0 (0x42480000)
```

MPYF32 RaH, RbH, RcH || SUBF32 RdH, ReH, RfH 32-bit Floating-Point Multiply with Parallel Subtract

Operands

RaH	floating-point destination register for MPYF32 (R0H to R7H) RaH cannot be the same register as RdH
RbH	floating-point source register for MPYF32 (R0H to R7H)
RcH	floating-point source register for MPYF32 (R0H to R7H)
RdH	floating-point destination register for SUBF32 (R0H to R7H) RdH cannot be the same register as RaH
ReH	floating-point source register for SUBF32 (R0H to R7H)
RfH	floating-point source register for SUBF32 (R0H to R7H)

Opcode

LSW: 1110 0111 0101 00ff MSW: feee dddc cbbb baaa

Description

Multiply the contents of two floating-point registers with parallel subtraction of two registers.

$$\begin{aligned} \text{RaH} &= \text{RbH} * \text{RcH}, \\ \text{RdH} &= \text{ReH} - \text{RfH} \end{aligned}$$

Restrictions

The destination register for the MPYF32 and the SUBF32 must be unique. That is, RaH cannot be the same register as RdH.

Flags

This instruction modifies the following flags in the STF register:.

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 or SUBF32 generates an underflow condition.
- LVF = 1 if MPYF32 or SUBF32 generates an overflow condition.

Pipeline

MPYF32 and SUBF32 both take 2 pipeline-cycles (2p). That is:

```

MPYF32 RaH, RbH, RcH ; 2 pipeline cycles (2p)
|| SUBF32 RdH, ReH, RfH ; 2 pipeline cycles (2p)
NOP                      ; 1 cycle delay or non-conflicting instruction
                          ; <-- MPYF32, SUBF32 complete. RaH, RdH updated
NOP
```

Any instruction in the delay slot must not use RaH or RdH as a destination register or as a source operand.

Example

```

MOVIZF32 R4H, #5.0 ; R4H = 5.0 (0x40A00000)
MOVIZF32 R5H, #3.0 ; R5H = 3.0 (0x40400000)
MPYF32 R6H, R4H, R5H ; R6H = R4H * R5H
|| SUBF32 R7H, R4H, R5H ; R7H = R4H - R5H NOP
                        ; 1 cycle delay for MPYF32 || SUBF32 to complete
                        ; <-- MPYF32 || SUBF32 complete,
                        ; R6H = 15.0 (0x41700000), R7H = 2.0 (0x40000000)
```

NEGF32 RaH, RbH{, CNDF} Conditional Negation

Operands

RaH	floating-point destination register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)
CNDF	condition tested

Opcode

```
LSW: 1110 0110 1010 CNDF
MSW: 0000 0000 00bb baaa
```

Description

```
if (CNDF == true) {RaH = - RbH }
else {RaH = RbH }
```

CNDF is one of the following conditions:

Encode ⁽¹⁾	CNDF	Description	STF Flags Tested
0000	NEQ	Not equal to zero	ZF == 0
0001	EQ	Equal to zero	ZF == 1
0010	GT	Greater than zero	ZF == 0 AND NF == 0
0011	GEQ	Greater than or equal to zero	NF == 0
0100	LT	Less than zero	NF == 1
0101	LEQ	Less than or equal to zero	ZF == 1 AND NF == 1
1010	TF	Test flag set	TF == 1
1011	NTF	Test flag not set	TF == 0
1100	LU	Latched underflow	LUF == 1
1101	LV	Latched overflow	LVF == 1
1110	UNC	Unconditional	None
1111	UNCF ⁽²⁾	Unconditional with flag modification	None

⁽¹⁾ Values not shown are reserved.

⁽²⁾ This is the default operation if no CNDF field is specified. This condition will allow the ZF, NF, ZI, and NI flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes	No	No

Pipeline

This is a single-cycle instruction.

Example

```
MOVIZF32 R0H, #5.0 ; R0H = 5.0 (0x40A00000)
MOVIZF32 R1H, #4.0 ; R1H = 4.0 (0x40800000)
MOVIZF32 R2H, #-1.5 ; R2H = -1.5 (0xBFC00000)

MPYF32 R4H, R1H, R2H ; R4H = -6.0
MPYF32 R5H, R0H, R1H ; R5H = 20.0
; <-- R4H valid
CMPF32 R4H, #0.0 ; NF = 1
; <-- R5H valid
NEGF32 R4H, R4H, LT ; if NF = 1, R4H = 6.0
CMPF32 R5H, #0.0 ; NF = 0
NEGF32 R5H, R5H, GEQ ; if NF = 0, R4H = -20.0
```

POP RB *Pop the RB Register from the Stack*

Operands

RB	repeat block register
----	-----------------------

Opcode LSW: 1111 1111 1111 0001

Description Restore the RB register from stack. If a high-priority interrupt contains a RPTB instruction, then the RB register must be stored on the stack before the RPTB block and restored after the RTPB block. In a low-priority interrupt RB must always be saved and restored. This save and restore must occur when interrupts are disabled.

Flags This instruction does not affect any flags floating-point Unit:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline This is a single-cycle instruction.

Example A high priority interrupt is defined as an interrupt that cannot itself be interrupted. In a high priority interrupt, the RB register must be saved if a RPTB block is used within the interrupt. If the interrupt service routine does not include a RPTB block, then you do not have to save the RB register.

```
; Repeat Block within a High-Priority Interrupt (Non-Interruptible)
_Interrupt:      ; RAS = RA, RA = 0
...
PUSH RB          ; Save RB register only if a RPTB block is used in the
ISR
...
...
RPTB #BlockEnd, AL ; Execute the block AL+1 times
...
...
BlockEnd         ; End of block to be repeated
...
...
POP RB           ; Restore RB register
...
IRET             ; RA = RAS, RAS = 0
```

A low-priority interrupt is defined as an interrupt that allows itself to be interrupted. The RB register must always be saved and restored in a low-priority interrupt. The RB register must stored before interrupts are enabled. Likewise before restoring the RB register interrupts must first be disabled.

```
; Repeat Block within a Low-Priority Interrupt (Interruptible)
_Interrupt:      ; RAS = RA, RA = 0
...
PUSH RB          ; Always save RB register
...
CLRC INTM        ; Enable interrupts only after saving RB
...
...              ; ISR may or may not include a RPTB block
...
SETC INTM        ; Disable interrupts before restoring RB
...
POP RB           ; Always restore RB register
...
IRET             ; RA = RAS, RAS = 0
```

PUSH RB *Push the RB Register onto the Stack*

Operands

RB	repeat block register
----	-----------------------

Opcode LSW: 1111 1111 1111 0000

Description Save the RB register on the stack. If a high-priority interrupt contains a RPTB instruction, then the RB register must be stored on the stack before the RPTB block and restored after the RTPB block. In a low-priority interrupt RB must always be saved and restored. This save and restore must occur when interrupts are disabled.

Flags This instruction does not affect any flags floating-point Unit:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline This is a single-cycle instruction for the first iteration, and zero cycles thereafter.

Example A high priority interrupt is defined as an interrupt that cannot itself be interrupted. In a high priority interrupt, the RB register must be saved if a RPTB block is used within the interrupt. If the interrupt service routine does not include a RPTB block, then you do not have to save the RB register.

```
; Repeat Block within a High-Priority Interrupt (Non-Interruptible)
__Interrupt:                ; RAS = RA, RA = 0
...
PUSH RB                    ; Save RB register only if a RPTB block is used in the
ISR
...
RPTB #BlockEnd, AL        ; Execute the block AL+1 times
...
...
BlockEnd                  ; End of block to be repeated
...
POP RB                    ; Restore RB register
...
IRET                      ; RA = RAS, RAS = 0
```

A low-priority interrupt is defined as an interrupt that allows itself to be interrupted. The RB register must always be saved and restored in a low-priority interrupt. The RB register must stored before interrupts are enabled. Likewise before restoring the RB register interrupts must first be disabled.

```
; Repeat Block within a Low-Priority Interrupt (Interruptible)
__Interrupt:                ; RAS = RA, RA = 0
...
PUSH RB                    ; Always save RB register
...
CLRC INTM                 ; Enable interrupts only after saving RB
...
...                       ; ISR may or may not include a RPTB block
...
SETC INTM                 ; Disable interrupts before restoring RB
...
POP RB                    ; Always restore RB register
...
IRET                      ; RA = RAS, RAS = 0
```

RESTORE *Restore the Floating-Point Registers*

Operands

none	This instruction does not have any operands
------	---

Opcode

LSW: 1110 0101 0110 0010

Description

Restore the floating-point register set (R0H - R7H and STF) from their shadow registers. The SAVE and RESTORE instructions should be used in high-priority interrupts. That is interrupts that cannot themselves be interrupted. In low-priority interrupt routines the floating-point registers should be pushed onto the stack.

Restrictions

The RESTORE instruction cannot be used in any delay slots for pipelined operations. Doing so will yield invalid results. To avoid this, the proper number of NOPs or non-pipelined instructions must be inserted before the RESTORE operation.

```
; The following is INVALID
MPYF32 R2H, R1H, R0H      ; 2 pipeline-cycle instruction (2p)
RESTORE                   ; INVALID, do not use RESTORE in a delay slot

; The following is VALID
MPYF32 R2H, R1H, R0H      ; 2 pipeline-cycle instruction (2p)
NOP                       ; 1 delay cycle, R2H updated after this instruction
RESTORE                   ; VALID
```

Flags

Restoring the status register will overwrite all flags:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	Yes	Yes	Yes	Yes	Yes	Yes	Yes

Pipeline

This is a single-cycle instruction.

Example

The following example shows a complete context save and restore for a high-priority interrupt. Note that the CPU automatically stores the following registers: ACC, P, XT, ST0, ST1, IER, DP, AR0, AR1 and PC. If an interrupt is low priority (that is it can be interrupted), then push the floating point registers onto the stack instead of using the SAVE and RESTORE operations.

```
; Interrupt Save
_HighestPriorityISR: ; Uninterruptable
    ASP                ; Align stack
    PUSH  RB           ; Save RB register if used in the ISR
    PUSH  AR1H:AR0H    ; Save other registers if used
    PUSH  XAR2
    PUSH  XAR3
    PUSH  XAR4
    PUSH  XAR5
    PUSH  XAR6
    PUSH  XAR7
    PUSH  XT
    SPM    0            ; Set default C28 modes
    CLRC   AMODE
    CLRC   PAGE0,OVM
    SAVE   RNDP32=1     ; Save all FPU registers
    ...           ; set default FPU modes
    ...
; Interrupt Restore
    ...
    RESTORE            ; Restore all FPU registers
    POP   XT           ; restore other registers
    POP   XAR7
    POP   XAR6
    POP   XAR5
    POP   XAR4
    POP   XAR3
    POP   XAR2
    POP   AR1H:AR0H
    POP   RB           ; restore RB register
    NASP              ; un-align stack
    IRET              ; return from interrupt
```

See also
[SAVE FLAG, VALUE](#)

RPTB label, loc16 *Repeat A Block of Code*

Operands

label	This label is used by the assembler to determine the end of the repeat block and to calculate RSIZE. This label should be placed immediately after the last instruction included in the repeat block.
loc16	16-bit location for the repeat count value.

Opcode

```
LSW: 1011 0101 0bbb bbbb
MSW: 0000 0000 loc16
```

Description

Initialize repeat block loop, repeat count from [loc16]

Restrictions

- The maximum block size is ≤ 127 16-bit words.
- An even aligned block must be ≥ 9 16-bit words.
- An odd aligned block must be ≥ 8 16-bit words.
- Interrupts must be disabled when saving or restoring the RB register.
- Repeat blocks cannot be nested.
- Any discontinuity type operation is not allowed inside a repeat block. This includes all call, branch or TRAP instructions. Interrupts are allowed.
- Conditional execution operations are allowed.

Flags

This instruction does not affect any flags in the floating-point unit:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This instruction takes four cycles on the first iteration and zero cycles thereafter. No special pipeline alignment is required.

Example

The minimum size for the repeat block is 8 words if the block is even aligned and 9 words if the block is odd aligned. If you have a block of 8 words, as in the following example, you can make sure the block is odd aligned by proceeding it by a .align 2 directive and a NOP instruction. The .align 2 directive will make sure the NOP is even aligned. Since a NOP is a 16-bit instruction the RPTB will be odd aligned. For blocks of 9 or more words, this is not required.

```
; Repeat Block of 8 Words (Interruptible)
;
; find the largest element and put its address in XAR6
.align 2

NOP
RPTB    VECTOR_MAX_END, AR7    ; Execute the block AR7+1 times
MOVL    ACC, XAR0
MOV32   R1H, *XAR0++           ; min size = 8, 9 words
MAXF32  R0H, R1H               ; max size = 127 words
MOVST0  NF, ZF
MOVL    XAR6, ACC, LT
VECTOR_MAX_END:                ; label indicates the end
                                ; RA is cleared
```

When an interrupt is taken the repeat active (RA) bit in the RB register is automatically copied to the repeat active shadow (RAS) bit. When the interrupt exits, the RAS bit is automatically copied back to the RA bit. This allows the hardware to keep track if a repeat loop was active whenever an interrupt is taken and restore that state automatically.

A high priority interrupt is defined as an interrupt that cannot itself be interrupted. In a high priority interrupt, the RB register must be saved if a RPTB block is used within the interrupt. If the interrupt service routine does not include a RPTB block, then you do not have to save the RB register.

```
; Repeat Block within a High-Priority Interrupt (Non-Interruptible)
;
; Interrupt:                ; RAS = RA, RA = 0
...
    PUSH RB                ; Save RB register only if a RPTB block is used in the
ISR
...
...
    RPTB #BlockEnd, AL      ; Execute the block AL+1 times
...
...
...
BlockEnd                    ; End of block to be repeated
...
...
    POP  RB                ; Restore RB register
...
    IRET                   ; RA = RAS, RAS = 0
```

A low-priority interrupt is defined as an interrupt that allows itself to be interrupted. The RB register must always be saved and restored in a low-priority interrupt. The RB register must stored before interrupts are enabled. Likewise before restoring the RB register interrupts must first be disabled.

```
; Repeat Block within a Low-Priority Interrupt (Interruptible)
;
; Interrupt:                ; RAS = RA, RA = 0
...
    PUSH RB                ; Always save RB register
...
    CLRC INTM              ; Enable interrupts only after saving RB
...
...
...                        ; ISR may or may not include a RPTB block
...
...
    SETC INTM              ; Disable interrupts before restoring RB
...
    POP  RB                ; Always restore RB register
...
    IRET                   ; RA = RAS, RAS = 0
```

RPTB label, #RC *Repeat a Block of Code*

Operands

label	This label is used by the assembler to determine the end of the repeat block and to calculate RSIZE. This label should be placed immediately after the last instruction included in the repeat block.
#RC	16-bit immediate value for the repeat count.

Opcode

```
LSW: 1011 0101 1bbb bbbb
MSW: cccc cccc cccc cccc
```

Description

Repeat a block of code. The repeat count is specified as a immediate value.

Restrictions

- The maximum block size is ≤ 127 16-bit words.
- An even aligned block must be ≥ 9 16-bit words.
- An odd aligned block must be ≥ 8 16-bit words.
- Interrupts must be disabled when saving or restoring the RB register.
- Repeat blocks cannot be nested.
- Any discontinuity type operation is not allowed inside a repeat block. This includes all call, branch or TRAP instructions. Interrupts are allowed.
- Conditional execution operations are allowed.

Flags

This instruction does not affect any flags in the floating-point unit:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This instruction takes one cycle on the first iteration and zero cycles thereafter. No special pipeline alignment is required.

Example

The minimum size for the repeat block is 8 words if the block is even aligned and 9 words if the block is odd aligned. If you have a block of 8 words, as in the following example, you can make sure the block is odd aligned by proceeding it by a .align 2 directive and a NOP instruction. The .align 2 directive will make sure the NOP is even aligned. Since a NOP is a 16-bit instruction the RPTB will be odd aligned. For blocks of 9 or more words, this is not required.

```
; Repeat Block (Interruptible)
;
; find the largest element and put its address in XAR6
.align 2

NOP
RPTB    VECTOR_MAX_END, #(4-1)    ; Execute the block 4 times
MOVL    ACC,XAR0
MOV32   R1H,*XAR0++                ; 8 or 9 words    block size    127 words
MAXF32  R0H,R1H
MOVST0  NF,ZF
MOVL    XAR6,ACC,LT
VECTOR_MAX_END:                    ; RE indicates the end address
                                        ; RA is cleared
```

When an interrupt is taken the repeat active (RA) bit in the RB register is automatically copied to the repeat active shadow (RAS) bit. When the interrupt exits, the RAS bit is automatically copied back to the RA bit. This allows the hardware to keep track if a repeat loop was active whenever an interrupt is taken and restore that state automatically.

A high priority interrupt is defined as an interrupt that cannot itself be interrupted. In a high priority interrupt, the RB register must be saved if a RPTB block is used within the interrupt. If the interrupt service routine does not include a RPTB block, then you do not have to save the RB register.

```
; Repeat Block within a High-Priority Interrupt (Non-Interruptible)
;
; Interrupt:                ; RAS = RA, RA = 0
...
PUSH RB                    ; Save RB register only if a RPTB block is used in the
ISR
...
...
RPTB #BlockEnd, #5         ; Execute the block 5+1 times
...
...
BlockEnd                   ; End of block to be repeated
...
...
POP  RB                    ; Restore RB register
...
IRET                       ; RA = RAS, RAS = 0
```

A low-priority interrupt is defined as an interrupt that allows itself to be interrupted. The RB register must always be saved and restored in a low-priority interrupt. The RB register must be stored before interrupts are enabled. Likewise before restoring the RB register interrupts must first be disabled.

```
; Repeat Block within a Low-Priority Interrupt (Interruptible)
;
; Interrupt:                ; RAS = RA, RA = 0
...
PUSH RB                    ; Always save RB register
...
CLRC INTM                  ; Enable interrupts only after saving RB
...
...
; ISR may or may not include a RPTB block
...
SETC INTM                  ; Disable interrupts before restoring RB
...
POP  RB                    ; Always restore RB register
...
IRET                       ; RA = RAS, RAS = 0
```

SAVE FLAG, VALUE *Save Register Set to Shadow Registers and Execute SETFLG*

Operands

FLAG	11 bit mask indicating which floating-point status flags to change.
VALUE	11 bit mask indicating the flag value; 0 or 1.

Opcode

```
LSW: 1110 0110 01FF FFFF
MSW: FFFF FVVV VVVV VVVV
```

Description

This operation copies the current working floating-point register set (R0H to R7H and STF) to the shadow register set and combines the SETFLG FLAG, VALUE operation in a single cycle. The status register is copied to the shadow register before the flag values are changed. The STF[SHDWM] flag is set to 1 when the SAVE command has been executed. The SAVE and RESTORE instructions should be used in high-priority interrupts. That is interrupts that cannot themselves be interrupted. In low-priority interrupt routines the floating-point registers should be pushed onto the stack.

Restrictions

Do not use the SAVE instruction in the delay slots for pipelined operations. Doing so can yield invalid results. To avoid this, the proper number of NOPs or non-pipelined instructions must be inserted before the SAVE operation.

```
; The following is INVALID
MPYF32 R2H, R1H, R0H ; 2 pipeline-cycle instruction (2p)
SAVE RND32=1          ; INVALID, do not use SAVE in a delay slot
; The following is VALID
MPYF32 R2H, R1H, R0H ; 2 pipeline-cycle instruction (2p)
NOP                   ; 1 delay cycle, R2H updated after this instruction
SAVE RND32=1          ; VALID
```

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	Yes	Yes	Yes	Yes	Yes	Yes	Yes

Any flag can be modified by this instruction.

Pipeline

This is a single-cycle instruction.

Example

To make it easier and more legible, the assembler will accept a FLAG=VALUE syntax for the SETFLG operation as shown below:

```
SAVE RND32=0, TF=1, ZF=0 ; FLAG = 01001000100, VALUE = X0XX0XXX1XX
MOVST0 TF, ZF, LUF       ; Copy the indicated flags to ST0
                          ; Note: X means this flag will not be modified.
                          ; The assembler will set these X values to 0.
```

The following example shows a complete context save and restore for a high priority interrupt. Note that the CPU automatically stores the following registers: ACC, P, XT, ST0, ST1, IER, DP, AR0, AR1 and PC.

```

_HighestPriorityISR:
ASP                ;Align stack
PUSH RB           ; Save RB register if used in the ISR
PUSH AR1H:AR0H    ; Save other registers if used
PUSH XAR2
PUSH XAR3
PUSH XAR4
PUSH XAR5
PUSH XAR6
PUSH XAR7
PUSH XT
SPM 0             ; Set default C28 modes
CLRC AMODE
CLRC PAGE0,OVM
SAVE RNDF32=0     ; Save all FPU registers
...              ; set default FPU modes
...
...
RESTORE           ; Restore all FPU registers
POP XT           ; restore other registers
POP XAR7
POP XAR6
POP XAR5
POP XAR4
POP XAR3
POP XAR2
POP AR1H:AR0H
POP RB           ; restore RB register
NASP            ; un-align stack IRET
                ; return from interrupt

```

[RESTORE
SETFLG FLAG, VALUE](#)

SETFLG FLAG, VALUE *Set or clear selected floating-point status flags*

Operands

FLAG	11 bit mask indicating which floating-point status flags to change.
VALUE	11 bit mask indicating the flag value; 0 or 1.

Opcode

```
LSW: 1110 0110 00FF FFFF
MSW: FFFF FVVV VVVV VVVV
```

Description

The SETFLG instruction is used to set or clear selected floating-point status flags in the STF register. The FLAG field is an 11-bit value that indicates which flags will be changed. That is, if a FLAG bit is set to 1 it indicates that flag will be changed; all other flags will not be modified. The bit mapping of the FLAG field is shown below:

10	9	8	7	6	5	4	3	2	1	0
reserved	RNDF32	reserved	reserved	TF	ZI	NI	ZF	NF	LUF	LVF

The VALUE field indicates the value the flag should be set to; 0 or 1.

Restrictions

Do not use the SETFLG instruction in the delay slots for pipelined operations. Doing so can yield invalid results. To avoid this, the proper number of NOPs or non-pipelined instructions must be inserted before the SETFLG operation.

```
; The following is INVALID
MPYF32 R2H, R1H, R0H ; 2 pipeline-cycle instruction (2p)
SETFLG RNDF32=1      ; INVALID, do not use SETFLG in a delay slot

; The following is VALID
MPYF32 R2H, R1H, R0H ; 2 pipeline-cycle instruction (2p)
NOP                  ; 1 delay cycle, R2H updated after this instruction
SETFLG RNDF32=1      ; VALID
```

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	Yes	Yes	Yes	Yes	Yes	Yes	Yes

Any flag can be modified by this instruction.

Pipeline

This is a single-cycle instruction.

Example

To make it easier and legible, the assembler will accept a FLAG=VALUE syntax for the SETFLG operation as shown below:

```
SETFLG RNDF32=0, TF=1, ZF=0 ; FLAG = 01001001000, VALUE = X0XX1XX0XXX
MOVST0 TF, ZF, LUF          ; Copy the indicated flags to ST0
                              ; X means this flag is not modified.
                              ; The assembler will set X values to 0
```

SUBF32 RaH, RbH, RcH 32-bit Floating-Point Subtraction

Operands

RaH	floating-point destination register (R0H to R1)
RbH	floating-point source register (R0H to R1)
RcH	floating-point source register (R0H to R1)

Opcode

LSW: 1110 0111 0010 0000
MSW: 0000 000c cbbb baaa

Description

Subtract the contents of two floating-point registers

$RaH = RbH - RcH$

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 generates an underflow condition.
- LVF = 1 if MPYF32 generates an overflow condition.

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
SUBF32 RaH, RbH, RcH ; 2 pipeline cycles (2p)
NOP                    ; 1 cycle delay or non-conflicting instruction
                        ; <-- SUBF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or as a source operand.

Example

Calculate $Y - A + B - C$:

```
MOVL XAR4, #A
MOV32 R0H, *XAR4 ; Load R0H with A
MOVL XAR4, #B
MOV32 R1H, *XAR4 ; Load R1H with B
MOVL XAR4, #C
ADDF32 R0H,R1H,R0H ; Add A + B and in parallel
|| MOV32 R2H,*XAR4 ; Load R2H with C

                        ; <-- ADDF32 complete
SUBF32 R0H,R0H,R2H ; Subtract C from (A + B)
NOP
                        ; <-- SUBF32 completes
MOV32 *XAR4,R0H ; Store the result
```

SUBF32 RaH, #16FHi, RbH 32-bit Floating Point Subtraction

Operands

RaH	floating-point destination register (R0H to R1)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.
RbH	floating-point source register (R0H to R1)

Opcode

```
LSW: 1110 1000 11II IIII
MSW: IIII IIII IIbb baaa
```

Description

Subtract RbH from the floating-point value represented by the immediate operand. Store the result of the addition in RaH.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

$RaH = \#16FHi:0 - RbH$

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 generates an underflow condition.
- LVF = 1 if MPYF32 generates an overflow condition.

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
SUBF32 RaH, #16FHi, RbH ; 2 pipeline cycles (2p)
NOP                      ; 1 cycle delay or non-conflicting instruction
                          ; <-- SUBF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or as a source operand.

Example

Calculate $Y = 2.0 - (A + B)$:

```
MOVL XAR4, #A
MOV32 R0H, *XAR4 ; Load R0H with A
MOVL XAR4, #B
MOV32 R1H, *XAR4 ; Load R1H with B
ADDF32 R0H,R1H,R0H ; Add A + B and in parallel
NOP
                      ; <-- ADDF32 complete
SUBF32 R0H,#2.0,R2H ; Subtract (A + B) from 2.0
NOP
                      ; <-- SUBF32 completes
MOV32 *XAR4,R0H ; Store the result
```

SUBF32 RdH, ReH, RfH ||MOV32 RaH, mem32 32-bit Floating-Point Subtraction with Parallel Move
Operands

RdH	floating-point destination register (R0H to R7H) for the SUBF32 operation RdH cannot be the same register as RaH
ReH	floating-point source register (R0H to R7H) for the SUBF32 operation
RfH	floating-point source register (R0H to R7H) for the SUBF32 operation
RaH	floating-point destination register (R0H to R7H) for the MOV32 operation RaH cannot be the same register as RdH
mem32	pointer to 32-bit source memory location for the MOV32 operation

Opcode

```
LSW: 1110 0011 0010 fffe
MSW: eedd daaa mem32
```

Description

Subtract the contents of two floating-point registers and move from memory to a floating-point register.

$$RdH = ReH - RfH, RaH = [mem32]$$
Restrictions

The destination register for the SUBF32 and the MOV32 must be unique. That is, RaH cannot be the same register as RdH.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	Yes	Yes	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if SUBF32 generates an underflow condition.
- LVF = 1 if SUBF32 generates an overflow condition.

The MOV32 Instruction will set the NF, ZF, NI and ZI flags as follows:

```
NF = RaH(31);
ZF = 0;
if(RaH(30:23) == 0) { ZF = 1; NF = 0; }
NI = RaH(31);
ZI = 0;
if(RaH(31:0) == 0) ZI = 1;
```

Pipeline

SUBF32 is a 2 pipeline-cycle instruction (2p) and MOV32 takes a single cycle. That is:

```
SUBF32 RdH, ReH, RfH ; 2 pipeline cycles (2p)
|| MOV32 RaH, mem32 ; 1 cycle
; <-- MOV32 completes, RaH updated
NOP ; 1 cycle delay or non-conflicting instruction
; <-- SUBF32 completes, RdH updated
NOP
```

Any instruction in the delay slot must not use RdH as a destination register or as a source operand.

Example

```

        MOVL  XAR1, #0xC000      ; XAR1 = 0xC000
        SUBF32 R0H, R1H, R2H    ; (A) R0H = R1H - R2H
    ||  MOV32  R3H, *XAR1        ;
                                     ; <-- R3H valid
        MOV32  R4H, *+XAR1[2]    ;
                                     ; <-- (A) completes, R0H valid, R4H valid
        ADDF32 R5H, R4H, R3H    ; (B) R5H = R4H + R3H
    ||  MOV32  *+XAR1[4], R0H    ;
                                     ; <-- R0H stored
        MOVL  XAR2, #0xE000      ;
                                     ; <-- (B) completes, R5H valid
        MOV32  *XAR2, R5H        ;
                                     ; <-- R5H stored
    
```

SUBF32 RdH, ReH, RfH ||MOV32 mem32, RaH 32-bit Floating-Point Subtraction with Parallel Move
Operands

RdH	floating-point destination register (R0H to R7H) for the SUBF32 operation
ReH	floating-point source register (R0H to R7H) for the SUBF32 operation
RfH	floating-point source register (R0H to R7H) for the SUBF32 operation
mem32	pointer to 32-bit destination memory location for the MOV32 operation
RaH	floating-point source register (R0H to R7H) for the MOV32 operation

Opcode

```
LSW: 1110 0000 0010 fffe
MSW: eedd daaa mem32
```

Description

Subtract the contents of two floating-point registers and move from a floating-point register to memory.

```
RdH = ReH - RfH,
[mem32] = RaH
```

Flags

This instruction modifies the following flags in the STF register: [SUBF32 RdH, ReH, RfH || MOV32 RaH, mem32](#)

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	Yes	Yes

The STF register flags are modified as follows:

- LUF = 1 if SUBF32 generates an underflow condition.
- LVF = 1 if SUBF32 generates an overflow condition.

Pipeline

SUBF32 is a 2 pipeline-cycle instruction (2p) and MOV32 takes a single cycle. That is:

```
SUBF32 RdH, ReH, RfH ; 2 pipeline cycles (2p)
|| MOV32 mem32, RaH ; 1 cycle
; <-- MOV32 completes, mem32 updated
NOP ; 1 cycle delay or non-conflicting instruction
; <-- ADDF32 completes, RdH updated
NOP
```

Any instruction in the delay slot must not use RdH as a destination register or as a source operand.

Example

```
ADDF32 R3H, R6H, R4H ; (A) R3H = R6H + R4H and R7H = I3
|| MOV32 R7H, *-SP[2] ;
; <-- R7H valid
SUBF32 R6H, R6H, R4H ; (B) R6H = R6H - R4H
; <-- ADDF32 (A) completes, R3H valid
SUBF32 R3H, R1H, R7H ; (C) R3H = R1H - R7H and store R3H (A)
|| MOV32 *+XAR5[2], R3H ;
; <-- SUBF32 (B) completes, R6H valid
; <-- MOV32 completes, (A) stored
ADDF32 R4H, R7H, R1H ; R4H = D = R7H + R1H and store R6H (B)
|| MOV32 *+XAR5[6], R6H ;
; <-- SUBF32 (C) completes, R3H valid
; <-- MOV32 completes, (B) stored
MOV32 *+XAR5[0], R3H ; store R3H (C)
; <-- MOV32 completes, (C) stored
; <-- ADDF32 (D) completes, R4H valid
MOV32 *+XAR5[4], R4H ; store R4H (D)
; <-- MOV32 completes, (D) stored
```

SWAPF RaH, RbH{, CNDF} Conditional Swap

Operands

RaH	floating-point register (R0H to R7H)
RbH	floating-point register (R0H to R7H)
CNDF	condition tested

Opcode

```
LSW: 1110 0110 1110 CNDF
MSW: 0000 0000 00bb baaa
```

Description

Conditional swap of RaH and RbH.

if (CNDF == true) swap RaH and RbH

CNDF is one of the following conditions:

Encode ⁽¹⁾	CNDF	Description	STF Flags Tested
0000	NEQ	Not equal to zero	ZF == 0
0001	EQ	Equal to zero	ZF == 1
0010	GT	Greater than zero	ZF == 0 AND NF == 0
0011	GEQ	Greater than or equal to zero	NF == 0
0100	LT	Less than zero	NF == 1
0101	LEQ	Less than or equal to zero	ZF == 1 AND NF == 1
1010	TF	Test flag set	TF == 1
1011	NTF	Test flag not set	TF == 0
1100	LU	Latched underflow	LUF == 1
1101	LV	Latched overflow	LVF == 1
1110	UNC	Unconditional	None
1111	UNCF ⁽²⁾	Unconditional with flag modification	None

⁽¹⁾ Values not shown are reserved.

⁽²⁾ This is the default operation if no CNDF field is specified. This condition will allow the ZF, NF, ZI, and NI flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

Flags

This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

No flags affected

Pipeline

This is a single-cycle instruction.

Example

```
;find the largest element and put it in R1H
```

```

MOVL XAR1, #0xB000      ;
MOV32 R1H, *XAR1        ; Initialize R1H
.align 2

NOP
RPTB LOOP_END, #(10-1); Execute the block 10 times
MOV32 R2H, *XAR1++      ; Update R2H with next element
CMPF32 R2H, R1H         ; Compare R2H with R1H
SWAPF R1H, R2H, GT      ; Swap R1H and R2H if R2 > R1
NOP                     ; For minimum repeat block size
NOP                     ; For minimum repeat block size
LOOP_END:

```

TESTTF CNDF *Test STF Register Flag Condition*

Operands

CNDF	condition to test
------	-------------------

Opcode LSW: 1110 0101 1000 CNDF

Description Test the floating-point condition and if true, set the TF flag. If the condition is false, clear the TF flag. This is useful for temporarily storing a condition for later use.

```
if (CNDF == true) TF = 1; else TF = 0;
```

CNDF is one of the following conditions:

Encode ⁽¹⁾	CNDF	Description	STF Flags Tested
0000	NEQ	Not equal to zero	ZF == 0
0001	EQ	Equal to zero	ZF == 1
0010	GT	Greater than zero	ZF == 0 AND NF == 0
0011	GEQ	Greater than or equal to zero	NF == 0
0100	LT	Less than zero	NF == 1
0101	LEQ	Less than or equal to zero	ZF == 1 AND NF == 1
1010	TF	Test flag set	TF == 1
1011	NTF	Test flag not set	TF == 0
1100	LU	Latched underflow	LUF == 1
1101	LV	Latched overflow	LVF == 1
1110	UNC	Unconditional	None
1111	UNCF ⁽²⁾	Unconditional with flag modification	None

⁽¹⁾ Values not shown are reserved.

⁽²⁾ This is the default operation if no CNDF field is specified. This condition will allow the ZF, NF, ZI, and NI flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

Flags This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	Yes	No	No	No	No	No	No

```
TF = 0; if (CNDF == true) TF = 1;
```

Note: If (CNDF == UNC or UNCF), the TF flag will be set to 1.

Pipeline This is a single-cycle instruction.

Example

```

CMPF32 R0H, #0.0 ; Compare R0H against 0
TESTTF LT        ; Set TF if R0H less than 0 (NF == 0)
ABS R0H, R0H      ; Get the absolute value of R0H

; Perform calculations based on ABS R0H
MOVST0 TF         ; Copy TF to TC in ST0
SBF End, NTC      ; Branch to end if TF was not set
NEGF32 R0H, R0H
End

```

UI16TOF32 RaH, mem16 *Convert unsigned 16-bit integer to 32-bit floating-point value*
Operands

RaH	floating-point destination register (R0H to R7H)
mem16	pointer to 16-bit source memory location

Opcode

LSW: 1110 0010 1100 0100
MSW: 0000 0aaa mem16

Description

Convert the unsigned 16-bit integer to the 32-bit floating-point value.

RaH = UI16TOF32[mem16]

Flags

This instruction does not affect any flags:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
UI16TOF32 RaH, mem16 ; 2 pipeline cycles (2p)
NOP                  ; 1 cycle delay or non-conflicting instruction
                    ; <-- UI16TOF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or as a source operand.

Example

```
; float32 y,m,b;
; AdcRegs.RESULT0 is an unsigned int
; Calculate: y = (float)AdcRegs.ADCRESULT0 * m + b;
;
MOVW DP @0x01C4
UI16TOF32 R0H, @8      ; R0H = (float)AdcRegs.RESULT0
MOV32 R1H, *-SP[6]     ; R1H = M
                    ; <-- Conversion complete, R0H valid
MPYF32 R0H, R1H, R0H   ; R0H = (float)X * M
MOV32 R1H, *-SP[8]     ; R1H = B
                    ; <-- MPYF32 complete, R0H valid
ADDF32 R0H, R0H, R1H   ; R0H = Y = (float)X * M + B
NOP
                    ; <-- ADDF32 complete, R0H valid
MOV32 *-SP, R0H        ; Store Y
```

UI16TOF32 RaH, RbH *Convert unsigned 16-bit integer to 32-bit floating-point value*
Operands

RaH	floating-point destination register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)

Opcode

```
LSW: 1110 0110 1000 1111
MSW: 0000 0000 00bb baaa
```

Description

When converting F32 to I16/UI16 data format, the F32TOI16/UI16 operation truncates to zero while the F32TOI16R/UI16R operation will round to nearest (even) value.

RaH = UI16ToF32[RbH]

Flags

This instruction does not affect any flags:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
UI16TOF32 RaH, RbH ; 2 pipeline cycles (2p)
NOP                ; 1 cycle delay or non-conflicting instruction
                   ; <-- UI16TOF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or as a source operand.

Example

```
MOVXI R5H, #0x800F ; R5H[15:0] = 32783 (0x800F)
UI16TOF32 R6H, R5H ; R6H = UI16TOF32 (R5H[15:0])
NOP                ; 1 cycle delay for UI16TOF32 to complete
                   ; R6H = 32783.0 (0x47000F00)
```

UI32TOF32 RaH, mem32 *Convert Unsigned 32-bit Integer to 32-bit Floating-Point Value*
Operands

RaH	floating-point destination register (R0H to R7H)
mem32	pointer to 32-bit source memory location

Opcode

LSW: 1110 0010 1000 0100
MSW: 0000 0aaa mem32

Description

RaH = UI32ToF32[mem32]

Flags

This instruction does not affect any flags:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
UI32TOF32 RaH, mem32 ; 2 pipeline cycles (2p)
NOP                  ; 1 cycle delay non-conflicting instruction
                    ; <-- UI32TOF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or as a source operand.

Example

```
; unsigned long X
; float Y, M, B
; ...
; Calculate Y = (float)X * M + B
;
UI32TOF32 R0H, *-SP[2] ; R0H = (float)X
MOV32 R1H, *-SP[6]    ; R1H = M
                    ; <-- Conversion complete, R0H valid
MPYF32 R0H, R1H, R0H  ; R0H = (float)X * M
MOV32 R1H, *-SP[8]    ; R1H = B
                    ; <-- MPYF32 complete, R0H valid
ADDF32 R0H, R0H, R1H  ; R0H = Y = (float)X * M + B
NOP
                    ; <-- ADDF32 complete, R0H valid
MOV32 *-[SP], R0H     ; Store Y
```

UI32TOF32 RaH, RbH *Convert Unsigned 32-bit Integer to 32-bit Floating-Point Value*

Operands

RaH	floating-point destination register (R0H to R7H)
RbH	floating-point source register (R0H to R7H)

Opcode

LSW: 1110 0110 1000 1011
MSW: 0000 0000 00bb baaa

Description

RaH = UI32ToF32 RbH

Flags

This instruction does not affect any flags:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
UI32TOF32 RaH, RbH ; 2 pipeline cycles (2p)
NOP                ; 1 cycle delay or non-conflicting instruction
                   ; <-- UI32TOF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or as a source operand.

Example

```
MOVIZ R3H, #0x8000 ; R3H[31:16] = 0x8000
MOVXI R3H, #0x1111 ; R3H[15:0] = 0x1111
                   ; R3H = 2147488017
UI32TOF32 R4H, R3H ; R4H = UI32TOF32 (R3H)
NOP                ; 1 cycle delay for UI32TOF32 to complete
                   ; R4H = 2147488017.0 (0x4F000011)
```

ZERO RaH *Zero the Floating-Point Register RaH*

Operands

RaH	floating-point register (R0H to R7H)
-----	--------------------------------------

Opcode LSW: 1110 0101 1001 0aaa

Description Zero the indicated floating-point register:
RaH = 0

Flags This instruction modifies the following flags in the STF register:

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

No flags affected.

Pipeline This is a single-cycle instruction.

Example

```

;for(i = 0; i < n; i++)
;{
;  real += (x[2*i] * y[2*i]) - (x[2*i+1] * y[2*i+1]);
;  imag += (x[2*i] * y[2*i+1]) + (x[2*i+1] * y[2*i]);
;}
;Assume AR7 = n-1
      ZERO R4H ; R4H = real = 0
      ZERO R5H ; R5H = imag = 0
LOOP
      MOV AL, AR7
      MOV ACC, AL << 2
      MOV AR0, ACC
      MOV32 R0H, *+XAR4[AR0] ; R0H = x[2*i]
      MOV32 R1H, *+XAR5[AR0] ; R1H = y[2*i]
      ADD AR0, #2
      MPYF32 R6H, R0H, R1H; ; R6H = x[2*i] * y[2*i]
      MOV32 R2H, *+XAR4[AR0] ; R2H = x[2*i+1]
      MPYF32 R1H, R1H, R2H ; R1H = y[2*i] * x[2*i+2]
      MOV32 R3H, *+XAR5[AR0] ; R3H = y[2*i+1]
      MPYF32 R2H, R2H, R3H ; R2H = x[2*i+1] * y[2*i+1]
      ADDF32 R4H, R4H, R6H ; R4H += x[2*i] * y[2*i]
      MPYF32 R0H, R0H, R3H ; R0H = x[2*i] * y[2*i+1]
      ADDF32 R5H, R5H, R1H ; R5H += y[2*i] * x[2*i+2]
      SUBF32 R4H, R4H, R2H ; R4H -= x[2*i+1] * y[2*i+1]
      ADDF32 R5H, R5H, R0H ; R5H += x[2*i] * y[2*i+1]
      BANZ LOOP, AR7--

```

C28 Viterbi, Complex Math and CRC Unit-II (VCU-II)

This chapter provides an overview of the architectural structure and instruction set of the Viterbi, Complex Math and CRC Unit (VCU-II) and describes the architecture, pipeline, instruction set, and interrupts. The VCU is a fully-programmable block which accelerates the performance of communications-based algorithms. In addition to eliminating the need for a second processor to manage the communications link, the performance gains of the VCU provides headroom for future system growth and higher bit rates or, conversely, enables devices to operate at a lower MHz to reduce system cost and power consumption.

Any references to VCU or VCU-II in this chapter relate to Type 2 specifically. Information pertaining to an older VCU will have the module type listed explicitly. See the *TMS320x28xx, 28xxx DSP Peripheral Reference Guide* ([SPRU566](#)) for a list of all devices with a VCU module of the same type, to determine the differences between the types, and for a list of device-specific differences within a type.

Topic	Page

2.6 Rounding Mode	377

2.1 Overview

The C28x with VCU (C28x+VCU) processor extends the capabilities of the C28x fixed-point or floating-point CPU by adding registers and instructions to support the following algorithm types:

- **Viterbi decoding**

Viterbi decoding is commonly used in baseband communications applications. The viterbi decode algorithm consists of three main parts: branch metric calculations, compare-select (viterbi butterfly) and a traceback operation. [Table 2-1](#) shows a summary of the VCU performance for each of these operations.

Table 2-1. Viterbi Decode Performance

Viterbi Operation	VCU Cycles
Branch Metric Calculation (code rate = 1/2)	1
Branch Metric Calculation (code rate = 1/3)	2p
Viterbi Butterfly (add-compare-select)	2 ⁽¹⁾
Traceback per Stage	3 ⁽²⁾

⁽¹⁾ C28x CPU takes 15 cycles per butterfly.

⁽²⁾ C28x CPU takes 22 cycles per stage.

- **Cyclic redundancy check (CRC)**

CRC algorithms provide a straightforward method for verifying data integrity over large data blocks, communication packets, or code sections. The C28x+VCU can perform 8-, 16-, 24-, and 32-bit CRCs. For example, the VCU can compute the CRC for a block length of 10 bytes in 10 cycles. A CRC result register contains the current CRC which is updated whenever a CRC instruction is executed.

- **Complex math**

Complex math is used in many applications. The VCU A few of which are:

- Fast fourier transform (FFT)

The complex FFT is used in spread spectrum communications, as well in many signal processing algorithms.

- Complex filters

Complex filters improve data reliability, transmission distance, and power efficiency. The C28x+VCU can perform a complex I and Q multiply with coefficients (four multiplies) in a single cycle. In addition, the C28x+VCU can read/write the real and imaginary parts of 16-bit complex data to memory in a single cycle.

[Table 2-2](#) shows a summary of the VCU operations enabled by the VCU:

Table 2-2. Complex Math Performance

Complex Math Operation	VCU Cycles	Notes
Add Or Subtract	1	32 +/- 32 = 32-bit (Useful for filters)
Add or Subtract	1	16 +/- 32 = 15-bit (Useful for FFT)
Multiply	2p	16 x 16 = 32-bit
Multiply & Accumulate (MAC)	2p	32 + 32 = 32-bit, 16 x 16 = 32-bit
RPT MAC	2p+N	Repeat MAC. Single cycle after the first operation.

This C28x+VCU draws from the best features of digital signal processing; reduced instruction set computing (RISC); and microcontroller architectures, firmware, and tool sets. The C2000 features include a modified Harvard architecture and circular addressing. The RISC features are single-cycle instruction execution, register-to-register operations, and modified Harvard architecture (usable in Von Neumann mode). The microcontroller features include ease of use through an intuitive instruction set, byte packing and unpacking, and bit manipulation. The modified Harvard architecture of the CPU enables instruction and data fetches to be performed in parallel. The CPU can read instructions and data while it writes data simultaneously to maintain the single-cycle instruction operation across the pipeline. The CPU does this over six separate address/data buses.

Throughout this document the following notations are used:

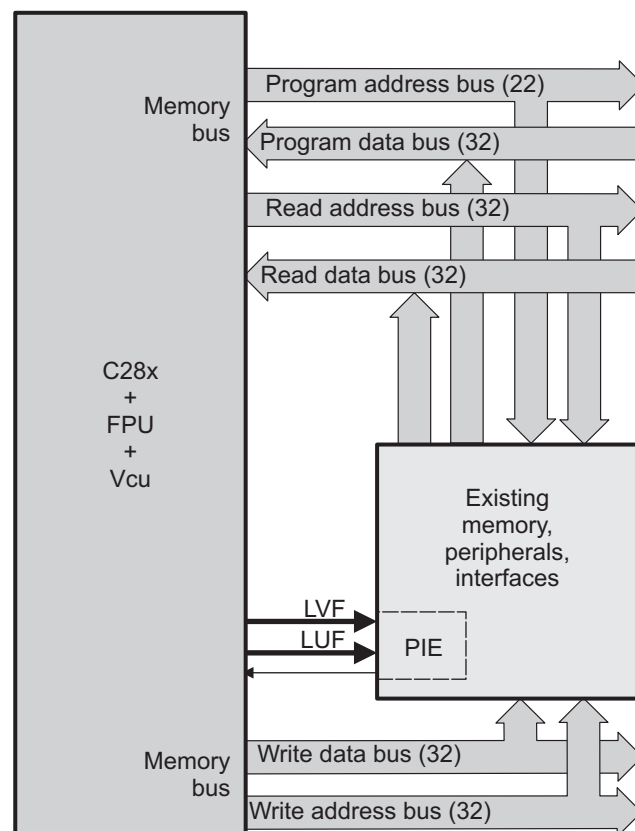

- C28x refers to the C28x fixed-point CPU.
- C28x plus Floating-Point and C28x+FPU both refer to the C28x CPU with enhancements to support IEEE single-precision floating-point operations.
- C28x plus VCU and C28x+VCU both refer to the C28x CPU with enhancements to support viterbi decode, complex math, forward error correcting algorithms, and CRC.
- Some devices have both the FPU and the VCU. These are referred to as C28x+FPU+VCU.

2.2 Components of the C28x Plus VCU

The VCU extends the capabilities of the C28x CPU and C28x+FPU processors by adding additional instructions. No changes have been made to existing instructions, pipeline, or memory bus architecture. Therefore, programs written for the C28x are completely compatible with the C28x+VCU. All of the features of the C28x documented in TMS320C28x DSP CPU and Instruction Set Reference Guide (literature number [SPRU430](#)) apply to the C28x+VCU. All features documented in the TMS320C28x Floating Point Unit and Instruction Set Reference Guide ([SPRUE02](#)) apply to the C28x+FPU+VCU.

[Figure 2-1](#) shows the block diagram of the VCU.

Figure 2-1. C28x + VCU Block Diagram

The C28x+VCU contains the same features as the C28x fixed-point CPU:

- A central processing unit for generating data and program-memory addresses; decoding and executing instructions; performing arithmetic, logical, and shift operations; and controlling data transfers among CPU registers, data memory, and program memory.
- Emulation logic for monitoring and controlling various parts and functions of the device and for testing device operation. This logic is identical to that on the C28x fixed-point CPU.
- Signals for interfacing with memory and peripherals, clocking and controlling the CPU and the emulation logic, showing the status of the CPU and the emulation logic, and using interrupts. This logic is identical to the C28x fixed-point CPU.
- Arithmetic logic unit (ALU). The 32-bit ALU performs 2s-complement arithmetic and Boolean logic operations.
- Address register arithmetic unit (ARAU). The ARAU generates data memory addresses and increments or decrements pointers in parallel with ALU operations.
- Fixed-Point instructions are pipeline protected. This pipeline for fixed-point instructions is identical to that on the C28x fixed-point CPU. The CPU implements an 8-phase pipeline that prevents a write to and a read from the same location from occurring out of order.
- Barrel shifter. This shifter performs all left and right shifts of fixed-point data. It can shift data to the left by up to 16 bits and to the right by up to 16 bits.
- Fixed-Point Multiplier. The multiplier performs 32-bit \times 32-bit 2s-complement multiplication with a 64-bit result. The multiplication can be performed with two signed numbers, two unsigned numbers, or one signed number and one unsigned number.

The VCU adds the following features:

- Instructions to support Cyclic Redundancy Check (CRC) or a polynomial code checksum
 - CRC8
 - CRC16
 - CRC32
 - CRC24
- Clocked at the same rate as the main CPU (SYSCLKOUT).
- Instructions to support a software implementation of a Viterbi Decoder of constraint length 4 - 7 and code rates of 1/2 and 1/3
 - Branch metrics calculations
 - Add-Compare Select or Viterbi Butterfly
 - Traceback
- Complex Math Arithmetic Unit
 - Add or Subtract
 - Multiply
 - Multiply and Accumulate (MAC)
 - Repeat MAC (RPT || MAC).
- Independent register space. These registers function as source and destination registers for VCU instructions.
- Some VCU instructions require pipeline alignment. This alignment is done through software to allow the user to improve performance by taking advantage of required delay slots. See [Section 2.4](#) for more information.

Devices with the floating-point unit also include:

- Floating point unit (FPU). The 32-bit FPU performs IEEE single-precision floating-point operations.
- Dedicated floating-point registers.

2.2.1 Emulation Logic

The emulation logic is identical to that on the C28x fixed-point CPU. This logic includes the following features. For more details about these features, refer to the TMS320C28x DSP CPU and Instruction Set Reference Guide (literature number [SPRU430](#)):

- Debug-and-test direct memory access (DT-DMA). A debug host can gain direct access to the content of registers and memory by taking control of the memory interface during unused cycles of the instruction pipeline
- A counter for performance benchmarking.
- Multiple debug events. Any of the following debug events can cause a break in program execution:
 - A breakpoint initiated by the ESTOP0 or ESTOP1 instruction.
 - An access to a specified program-space or data-space location. When a debug event causes the C28x to enter the debug-halt state, the event is called a break event.
- Real-time mode of operation.

2.2.2 Memory Map

Like the C28x, the C28x+VCU uses 32-bit data addresses and 22-bit program addresses. This allows for a total address reach of 4G words (1 word = 16 bits) in data space and 4M words in program space. Memory blocks on all C28x+VCU designs are uniformly mapped to both program and data space. For specific details about each of the map segments, see the device-specific data manual.

2.2.3 CPU Interrupt Vectors

The C28x+VCU interrupt vectors are identical to those on the C28x CPU. Sixty-four addresses in program space are set aside for a table of 32 CPU interrupt vectors. For more information about the CPU vectors, see TMS320C28x CPU and Instruction Set Reference Guide (literature number [SPRU430](#)). Typically the CPU interrupt vectors are only used during the boot up of the device by the boot ROM. Once an application has taken control it should initialize and enable the peripheral interrupt expansion block (PIE).

2.2.4 Memory Interface

The C28x+VCU memory interface is identical to that on the C28x. The C28x+VCU memory map is accessible outside the CPU by the memory interface, which connects the CPU logic to memories, peripherals, or other interfaces. The memory interface includes separate buses for program space and data space. This means an instruction can be fetched from program memory while data memory is being accessed. The interface also includes signals that indicate the type of read or write being requested by the CPU. These signals can select a specified memory block or peripheral for a given bus transaction. In addition to 16-bit and 32-bit accesses, the CPU supports special byte-access instructions that can access the least significant byte (LSByte) or most significant byte (MSByte) of an addressed word. Strobe signals indicate when such an access is occurring on a data bus.

2.2.5 Address and Data Buses

Like the C28x, the memory interface has three address buses:

- PAB: Program address bus: The 22-bit PAB carries addresses for reads and writes from program space.
- DRAB: Data-read address bus: The 32-bit DRAB carries addresses for reads from data space.
- DWAB: Data-write address bus: The 32-bit DWAB carries addresses for writes to data space.

The memory interface also has three data buses:

- PRDB: Program-read data bus: The 32-bit PRDB carries instructions during reads from program space.
- DRDB: Data-read data bus: The 32-bit DRDB carries data during reads from data space.
- DWDB: Data-/Program-write data bus: The 32-bit DWDB carries data during writes to data space or program space.

A program-space read and a program-space write cannot happen simultaneously because both use the PAB. Similarly, a program-space write and a data-space write cannot happen simultaneously because both use the DWDB. Transactions that use different buses can happen simultaneously. For example, the CPU can read from program space (using PAB and PRDB), read from data space (using DRAB and DRDB), and write to data space (using DWAB and DWDB) at the same time. This behavior is identical to the C28x CPU.

2.2.6 Alignment of 32-Bit Accesses to Even Addresses

The C28x+VPU expects memory wrappers or peripheral-interface logic to align any 32-bit read or write to an even address. If the address-generation logic generates an odd address, the CPU will begin reading or writing at the previous even address. This alignment does not affect the address values generated by the address-generation logic.

Most instruction fetches from program space are performed as 32-bit read operations and are aligned accordingly. However, alignment of instruction fetches are effectively invisible to a programmer. When instructions are stored to program space, they do not have to be aligned to even addresses. Instruction boundaries are decoded within the CPU.

You need to be concerned with alignment when using instructions that perform 32-bit reads from or writes to data space.

2.3 Register Set

Devices with the C28x+VCU include the standard C28x register set plus an additional set of VCU specific registers. The additional VCU registers are the following:

- Result registers: VR0, VR1... VR8
- Traceback registers: VT0, VT1
- Configuration and status register: VSTATUS
- CRC result register: VCRC
- Repeat block register: RB

Figure 2-2 shows the register sets for the 28x CPU, the FPU and the VCU. The following section discusses the VCU register set in detail.

Figure 2-2. C28x + FPU + VCU Registers

Standard C28x Register Set	Additional 32-bit FPU Registers	Standard VCU Register Set
ACC (32-bit)	R0H (32-bit)	VR0
P (32-bit)	R1H (32-bit)	VR1
XT (32-bit)	R2H (32-bit)	VR2
	R3H (32-bit)	VR3
XAR0 (32-bit)	R4H (32-bit)	VR4
XAR1 (32-bit)	R5H (32-bit)	VR5
XAR2 (32-bit)	R6H (32-bit)	VR6
XAR3 (32-bit)	R7H (32-bit)	VR7
XAR4 (32-bit)		VR8
XAR5 (32-bit)	FPU Status Register (STF)	VT0
XAR6 (32-bit)	Repeat Block Register (RB)	VT1
XAR7 (32-bit)		VSTATUS
PC (22-bit)		VCRC
RPC (22-bit)		VSM0
DP (16-bit)		VSM1
SP (16-bit)		...
		...
ST0 (16-bit)		VSM63
ST1 (16-bit)		
IER (16-bit)		
IFR (16-bit)		
DBGIER (16-bit)		

FPU registers R0H - R7H and STF are shadowed for fast context save and restore

2.3.1 VCU Register Set

Table 2-3 describes the VCU module register set. The last three columns indicate whether the particular module within the VCU can make use of the register.

Table 2-3. VCU Register Set

Register Name	Size	Description	Viterbi	Complex Math	CRC
VR0	32 bits	General purpose register 0	Yes	Yes	No
VR1	32 bits	General purpose register 1	Yes	Yes	No
VR2	32 bits	General purpose register 2	Yes	Yes	No
VR3	32 bits	General purpose register 3	Yes	Yes	No
VR4	32 bits	General purpose register 4	Yes	Yes	No
VR5	32 bits	General purpose register 5	Yes	Yes	No
VR6	32 bits	General purpose register 6	Yes	Yes	No
VR7	32 bits	General purpose register 7	Yes	Yes	No
VR8	32 bits	General purpose register 8	Yes	No	No
VT0	32 bits	32-bit transition bit register 0	Yes	No	No
VT1	32 bits	32-bit transition bit register 1	Yes	No	No
VSTATUS	32 bits	VCU status and configuration register ⁽¹⁾	Yes	Yes	No
VCRC	32 bits	Cyclic redundancy check (CRC) result register	No	No	Yes
VSM0-VSM63	32 bits	Viterbi Decoding State Metric registers	Yes	No	No
VRx.By x = 0 – 7 y = 0 - 3	32 bits	Aliased address space for each byte of the VRx registers, left-shifted by one	No	No	No

⁽¹⁾ Debugger writes are not allowed to the VSTATUS register.

Table 2-4 lists the CPU registers available on devices with the C28x, the C28x+FPU, the C28x+VCU and the C28x+FPU+VCU.

Table 2-4. 28x CPU Register Summary

Register	C28x CPU	C28x+FPU	C28x+VCU	C28x+FPU+VCU	Description
ACC	Yes	Yes	Yes	Yes	Fixed-point accumulator
AH	Yes	Yes	Yes	Yes	High half of ACC
AL	Yes	Yes	Yes	Yes	Low half of ACC
XAR0 - XAR7	Yes	Yes	Yes	Yes	Auxiliary register 0 - 7
AR0 - AR7	Yes	Yes	Yes	Yes	Low half of XAR0 - XAR7
DP	Yes	Yes	Yes	Yes	Data-page pointer
IFR	Yes	Yes	Yes	Yes	Interrupt flag register
IER	Yes	Yes	Yes	Yes	Interrupt enable register

2.3.2 VCU Status Register (VSTATUS)

The VCU status register (VSTATUS) register is described in [Figure 2-3](#). There is no single instruction to directly transfer the VSTATUS register to a C28x register. To transfer the contents:

1. Store VSTATUS into memory using [VMOV32 mem32, VSTATUS](#) instruction
2. Load the value from memory into a main C28x CPU register.

Configuration bits within the VSTATUS registers are set or cleared using VCU instructions.

Table 2-5. VCU Status (VSTATUS) Register Field Descriptions

Bits	Field	Value	Description
31	CRCMSGFLIP ⁽¹⁾	0 1	<p>CRC Message Flip</p> <p>This bit affects the order in which the bits in the message are taken for CRC calculation by all the CRC instructions.</p> <p>0 Message bits are taken starting from most-significant to least-significant for CRC computation. In this case, bytes loaded from memory are fed directly for CRC computation.</p> <p>1 Message bits are taken starting from least-significant to most-significant for CRC computation. In this case, bytes loaded from memory are “flipped” and then fed for CRC computation.</p>
30	DIVE ⁽¹⁾	0 1	<p>Divide-by-zero Error</p> <p>0 Indicates whether a “divide by zero” occurred during a VMOD32 computation. This bit is cleared by executing the VCLRDIVE instruction</p> <p>1</p>
29-27	K ⁽¹⁾	0x7 1	<p>Constraint Length for Viterbi Decoding</p> <p>This field sets the constraint length for the Viterbi decoding algorithm. It accepts values of 4 to 7. Values outside this range will be treated as 7 by the hardware.</p>
26-24	GFORDER ⁽¹⁾	0x7	<p>Galois Field Polynomial Order</p> <p>This field holds the Order of the polynomial for all the Galois Field instructions. This field is initialized by the VGFINIT mem16 instruction. The actual order of the polynomial is GFORDER+1</p>
23-16	GFPOLY ⁽¹⁾	0 1	<p>Galois Field Polynomial</p> <p>0 This field holds the Polynomial for all the Galois Field instructions. This field is initialized by the VGFINIT mem16 instruction.</p> <p>1</p>
15	OPACK ⁽¹⁾	0 1	<p>Viterbi Traceback Packing Order</p> <p>This bit affects the packing order of the traceback output bits (using the VTRACE instructions)</p> <p>0 Big-endian (compatible with VCU Type-0 output packing order)</p> <p>1 Little-endian (VCU Type-2 mode)</p>
14	CPACK ⁽¹⁾	0 1	<p>Complex Packing Order</p> <p>This bit affects the packing order of the 16-bit real and 16-bit imaginary part of a complex numbers inside the 32-bit general purpose VRx register.</p> <p>0 VRx[31:16] holds Real part, VRx[15:0] holds Imaginary part (VCU-I compatible mode)</p> <p>1 VRx[31:16] holds Imaginary part; VRx[15:0] holds Real part</p>

⁽¹⁾ Present on Type-2 VCU only.

Table 2-5. VCU Status (VSTATUS) Register Field Descriptions (continued)

Bits	Field	Value	Description
13	OVRI	0	Overflow or Underflow Flag: Imaginary Part No overflow or underflow has been detected.
		1	Indicates an overflow or underflow has occurred during the computation of the imaginary part of operations shown in Table 10-6. This bit will be set regardless of the value of the VSTATUS[SAT] bit. OVRI bit will remain set until it is cleared by executing the VCLROVFI instruction.
12	OVFR	0	Overflow or Underflow Flag: Real Part No overflow or underflow has been detected.
		1	Indicates overflow or underflow has occurred during a real number calculation for operations shown in Table 2-6. This bit will be set regardless of the value of the VSTATUS[SAT] bit. This bit will remain set until it is cleared by executing the VCLROVFR instruction.
11	RND		Rounding When a right-shift operation is performed the lower bits of the value will be lost. The RND bit determines if the shifted value is rounded or if the shifted-out bits are simply truncated. This is described in Section 2.3.2. Operations which use right-shift and rounding are shown in Table 2-6. The RND bit is set by the VRNDON instruction and cleared by the VRNDOFF instruction.
		0	Rounding is not performed. Bits shifted out right are truncated.
		1	Rounding is performed. Refer to the instruction descriptions for information on how the operation is affected by the RND bit.
10	SAT		Saturation This bit determines whether saturation will be performed for operations shown in Table 2-6. The SAT bit is set by the VSATON instruction and is cleared by the VSATOFF instruction.
		0	No saturation is performed.
		1	Saturation is performed.
9-5	SHIFTL		Left Shift Operations which use left-shift are shown in Table 2-6 The shift SHIFTL field can be set or cleared by the VSETSHL instruction.
		0	No left shift.
		0x01 - 0x1F	Refer to the instruction description for information on how the operation is affected by the shift value. During the left-shift, the lower bits are filled with 0's.
4-0	SHIFTR		Right Shift Operations which use right-shift and rounding are shown in Table 2-6. The shift SHIFTR field can be set or cleared by the VSETSHR instruction.
		0	No right shift.
		0x01 - 0x1F	Refer to the instruction descriptions for information on how the operation is affected by the shift value. During the right-shift, the lower bits are lost, and the shifted value is sign extended. If rounding is enabled (VSTATUS[RND] == 1), then the value will be rounded instead of truncated.

Table 2-6 shows a summary of the operations that are affected by or modify bits in the VSTATUS register.

Table 2-6. Operation Interaction With VSTATUS Bits

Operation ⁽¹⁾	Description	OVFI	OVFR	RND	SAT	SHIFTL	SHIFTR	CPACK	OPACK	DIVE

⁽³⁾ Present on Type-2 VCU only.

2.3.3 Repeat Block Register (RB)

The repeat block instruction (RPTB) applies to devices with the C28x+FPU and the C28x+VCU. This instruction allows you to repeat a block of code as shown in [Example 2-1](#).

Example 2-1. The Repeat Block (RPTB) Instruction uses the RB Register

```
; find the largest element and put its address in XAR6
;
; This example makes use of floating-point (C28x + FPU) instructions
;
;
MOV32 R0H, *XAR0++;
.align 2                ; Aligns the next instruction to an even address
NOP                    ; Makes RPTB odd aligned - required for a block size of 8
RPTB VECTOR_MAX_END, AR7 ; RA is set to 1
MOVL ACC,XAR0
MOV32 R1H,*XAR0++      ; RSIZE reflects the size of the RPTB block
MAXF32 R0H,R1H         ; in this case the block size is 8
MOVST0 NF,ZF
MOVL XAR6,ACC,LT
VECTOR_MAX_END:        ; RE indicates the end address. RA is cleared
```

The C28x FPU or VCU automatically populates the RB register based on the execution of a RPTB instruction. This register is not normally read by the application and does not accept debugger writes.

Figure 2-4. Repeat Block Register (RB)

31	30	29	23	22	16
RAS	RA	RSIZE			RE
R-0	R-0	R-0			R-0
15					0
RC					
R-0					

LEGEND: R = Read only; -n = value after reset

Table 2-7. Repeat Block (RB) Register Field Descriptions

Bits	Field	Value	Description
31	RAS	0 1	Repeat Block Active Shadow Bit When an interrupt occurs the repeat active, RA, bit is copied to the RAS bit and the RA bit is cleared. When an interrupt return instruction occurs, the RAS bit is copied to the RA bit and RAS is cleared. A repeat block was not active when the interrupt was taken. A repeat block was active when the interrupt was taken.
30	RA	0 1	Repeat Block Active Bit This bit is cleared when the repeat counter, RC, reaches zero. When an interrupt occurs the RA bit is copied to the repeat active shadow, RAS, bit and RA is cleared. When an interrupt return, IRET, instruction is executed, the RAS bit is copied to the RA bit and RAS is cleared. This bit is set when the RPTB instruction is executed to indicate that a RPTB is currently active.
29-23	RSIZE	0-7 8/9-0x7F	Repeat Block Size This 7-bit value specifies the number of 16-bit words within the repeat block. This field is initialized when the RPTB instruction is executed. The value is calculated by the assembler and inserted into the RPTB instruction's RSIZE opcode field. Illegal block size. A RPTB block that starts at an even address must include at least 9 16-bit words and a block that starts at an odd address must include at least 8 16-bit words. The maximum block size is 127 16-bit words. The codegen assembler will check for proper block size and alignment.

Table 2-7. Repeat Block (RB) Register Field Descriptions (continued)

Bits	Field	Value	Description
22-16	RE		<p>Repeat Block End Address</p> <p>This 7-bit value specifies the end address location of the repeat block. The RE value is calculated by hardware based on the RSIZE field and the PC value when the RPTB instruction is executed.</p> <p>RE = lower 7 bits of (PC + 1 + RSIZE)</p>
15-0	RC	<p>0</p> <p>1-0xFFFF</p>	<p>Repeat Count</p> <p>The block will not be repeated; it will be executed only once. In this case the repeat active, RA, bit will not be set.</p> <p>This 16-bit value determines how many times the block will repeat. The counter is initialized when the RPTB instruction is executed and is decremented when the PC reaches the end of the block. When the counter reaches zero, the repeat active bit is cleared and the block will be executed one more time. Therefore the total number of times the block is executed is RC+1.</p>

2.4 Pipeline

This section describes the VCU pipeline stages and presents cases where pipeline alignment must be considered.

2.4.1 Pipeline Overview

The C28x VCU pipeline is identical to the C28x pipeline for all standard C28x instructions. In the decode2 stage (D2), it is determined if an instruction is a C28x instruction, a FPU instruction, or a VCU instruction. The pipeline flow is shown in [Figure 2-5](#).

Notice that stalls due to normal C28x pipeline stalls (D2) and memory waitstates (R2 and W) will also stall any C28x VCU instruction. Most C28x VCU instructions are single cycle and will complete in the VCU E1 or W stage which aligns to the C28x pipeline. Some instructions will take an additional execute cycle (E2). For these instructions you must wait a cycle for the result from the instruction to be available. The rest of this section will describe when delay cycles are required. Keep in mind that the assembly tools for the C28x+VCU will issue an error if a delay slot has not been handled correctly.

Figure 2-5. C28x + FCU + VCU Pipeline

2.4.2 General Guidelines for VCU Pipeline Alignment

The majority of the VCU instructions do not require any special pipeline considerations. This section lists the few operations that do require special consideration.

While the C28x+VCU assembler will issue errors for pipeline conflicts, you may still find it useful to understand when software delays are required. This section describes three guidelines you can follow when writing C28x+VCU assembly code.

VCU instructions that require delay slots have a 'p' after their cycle count. For example '2p' stands for 2 pipelined cycles. This means that an instruction can be started every cycle, but the result of the instruction will only be valid one instruction later.

[Table 2-8](#) outlines the instructions that need delay slots.

Table 2-8. Operations Requiring a Delay Slot(s)

Operation ⁽¹⁾	Description	Cycles
VITBM3	Viterbi Branch Metric CR 1/3	2p/2 ⁽²⁾
VCMAC	Complex 32 + 32 = 32, 16 x 16 = 32	2p
VCCMAC ⁽³⁾	Complex Conjugate 32 + 32 = 32, 16 x 16 = 32	2p
VCMPY	Complex 16 x 16 = 32	2p
VCCMPY ⁽³⁾	Complex Conjugate 16 x 16 = 32	2p
VCMAG ⁽³⁾	Complex Number Magnitude	2
VCFFTx ⁽³⁾	Complex FFT calculation step (x = 1 – 10)	2p/2 ⁽²⁾
VMOD32	Modulo 32 % 16 = 16	9p
VMPYADD ⁽³⁾	Arithmetic Multiply Add 16 + ((16 x 16) >> SHR) = 16	2p

⁽¹⁾ Some parallel instructions also include these operations. In this case, the operation will also modify, or be affected by, VSTATUS bits as when used as part of a parallel instruction.

⁽²⁾ Variations of the instruction execute differently. In these cases, the user is referred to the description [Example 2-2](#) of the instruction(s) in [Section 2.5](#).

⁽³⁾ Present on Type-2 VCU only.

An example of the complex multiply instruction is shown in [Example 2-2](#). VCMPY is a 2p instruction and therefore requires one delay slot. The destination registers for the operation, VR2 and VR3, will be updated one cycle after the instruction for a total of two cycles. Therefore, a NOP or instruction that does not use VR2 or VR3 must follow this instruction.

Any memory stall or pipeline stall will also stall the VCU. This keeps the VCU aligned with the C28x pipeline and there is no need to change the code based on the waitstates of a memory block.

Example 2-2. 2p Instruction Pipeline Alignment

```
VCMPY VR3, VR2, VR1, VR0      ; 2 pipeline cycles (2p)
NOP                           ; 1 cycle delay or non-conflicting instruction
                               ; <-- VCMPY completes, VR2 and VR3 updated
NOP                           ; Any instruction
```

2.4.3 Parallel Instructions

Parallel instructions are single opcodes that perform two operations in parallel. The guidelines provided in [Section 2.4.2](#) apply to parallel instructions as well. In this case the cycle count will be given for both operations. For example, a branch metric calculation for code rate of 1/3 with a parallel load takes 2p/1 cycles. This means the branch metric portion of the operation takes two pipelined cycles while the move portion of the operation is single cycle. NOPs or other non conflicting instructions must be inserted to align the branch metric calculation portion of the operation as shown in [Example 2-4](#).

Example 2-3. Branch Metric CR 1/2 Calculation with Parallel Load

```
; VITBM2 || VMOV32 instruction: branch metrics calculation with parallel load
; VBITM2 is a 1 cycle operation (code rate = 1/2)
; VMOV32 is a 1 cycle operation
;
VITBM2 VR0      ; Load VR0 with the 2 branch metrics
|| VMOV32 VR2, @Val ; VR2 gets the contents of Val
                  ; <-- VMOV32 completes here (VR2 is valid)
                  ; <-- VITBM2 completes here (VR0 is valid)
<instruction 2>  ; Any instruction, can use VR2 and/or VR0
```

Example 2-4. Branch Metric CR 1/3 Calculation with Parallel Load

```

; VITBM3 || VMOV32 instruction: branch metrics calculation with parallel load
; VBITM3 is a 2p cycle operation (code rate = 1/3)
; VMOV32 is a 1 cycle operation
;
VITBM3   VR0, VR1, VR2      ; Load VR0 and VR1 with the 4 branch metrics
|| VMOV32 VR2, @Val          ; VR2 gets the contents of Val
; <-- VMOV32 completes here (VR2 is valid)
<instrucion 2>              ; Must not use VR0 or VR1. Can use VR2.
; <-- VITBM3 completes here (VR0, VR1 are valid)
<instruction 3>             ; Any instruction, can use VR2 and/or VR0

```

2.4.4 Invalid Delay Instructions

All VCU, FPU and fixed-point instructions can be used in VCU instruction delay slots as long as source and destination register conflicts are avoided. The C28x+VCU assembler will issue an error anytime you use an conflicting instruction within a delay slot. The following guidelines can be used to avoid these conflicts.

NOTE: *Destination register conflicts in delay slots:*

Any operation used for pipeline alignment delay must not use the same destination register as the instruction requiring the delay. See [Example 2-5](#).

In [Example 2-5](#) the VCMPLY instruction uses VR2 and VR3 as its destination registers. The next instruction should not use VR2 or VR3 as a destination. Since the VMOV32 instruction uses the VR3 register a pipeline conflict will be issued by the assembler. This conflict can be resolved by using a register other than VR2 for the VMOV32 instruction as shown in [Example 2-6](#).

Example 2-5. Destination Register Conflict

```
; Invalid delay instruction.
; Both instructions use the same destination register (VR3)
;
VCMPY VR3, VR2, VR1, VR0    ; 2p instruction
VMOV32 VR3, mem32           ; Invalid delay instruction
                             ; <-- VCMPLY completes, VR3, VR2 are valid
```

Example 2-6. Destination Register Conflict Resolved

```
; Valid delay instruction
;
VCMPY VR3, VR2, VR1, VR0    ; 2p instruction
VMOV32 VR7, mem32           ; Valid delay instruction
```

NOTE: *Instructions in delay slots cannot use the instruction's destination register as a source register.*

Any operation used for pipeline alignment delay must not use the destination register of the instruction requiring the delay as a source register as shown in [Example 2-7](#). For parallel instructions, the current value of a register can be used in the parallel operation before it is overwritten as shown in [Example 2-9](#).

In [Example 2-7](#) the VCMPLY instruction again uses VR3 and VR2 as its destination registers. The next instruction should not use VR3 or VR2 as its source since the VCMPLY will take an additional cycle to complete. Since the VCADD instruction uses the VR2 as a source register a pipeline conflict will be issued by the assembler. The use of VR3 will also cause a pipeline conflict. This conflict can be resolved by using a register other than VR2 or VR3 or by inserting a non-conflicting instruction between the VCMPLY and VCADD instructions. Since the VNEG does not use VR2 or VR3 this instruction can be moved before the VCADD as shown in [Example 2-8](#).

Example 2-7. Destination/Source Register Conflict

```
; Invalid delay instruction.
; VCADD should not use VR2 or VR3 as a source operand
;
VCMPY VR3, VR2, VR1, VR0    ; 2p instruction
VCADD VR5, VR4, VR3, VR2    ; Invalid delay instruction
VNEG VR0                     ; <- VCMPLY completes, VR3, VR2 valid
```

Example 2-8. Destination/Source Register Conflict Resolved

```
; Valid delay instruction.
;
VCMPY VR3, VR2, VR1, VR0    ; 2p instruction
VNEG VR0                     ; Non conflicting instruction or NOP
VCADD VR5, VR4, VR3, VR2    ; <- VCMPLY completes, VR3, VR2 valid
```

It should be noted that a source register for the second operation within a parallel instruction can be the same as the destination register of the first operation. This is because the two operations are started at the same time. The second operation is not in the delay slot of the first operation. Consider [Example 2-9](#) where the VCMPLY uses VR3 and VR2 as its destination registers. The VMOV32 is the second operation in the instruction and can freely use VR3 or VR2 as a source register. In the example, the contents of VR3 before the multiply will be used by MOV32.

Example 2-9. Parallel Instruction Destination/Source Exception

```
; Valid parallel operation.
;
VCMPY VR3, VR2, VR1, VR0 ; 2p/1 instruction
|| VMOV32 mem32, VR3      ; <-- Uses VR3 before the VCMPY update
                           ; <-- mem32 updated
NOP                       ; <-- Delay for VCMPY
                           ; <-- VR2, VR3 updated
```

Likewise, the source register for the second operation within a parallel instruction can be the same as one of the source registers of the first operation. The VCMPY operation in [Example 2-10](#) uses the VR0 register as one of its sources. This register is also updated by the VMOV32 instruction. The multiplication operation will use the value in VR0 before the VMOV32 updates it.

Example 2-10. Parallel Instruction Destination/Source Exception

```
; Valid parallel operation.
VCMPY VR3, VR2, VR1, VR0 ; 2p/1 instruction
|| VMOV32 VR0, mem32      ; <-- Uses VR3 before the VCMPY update
                           ; <-- mem32 updated
NOP                       ; <-- Delay for VCMPY
                           ; <-- VR2, VR3 updated
```

NOTE: *Operations within parallel instructions cannot use the same destination register.*

When two parallel operations have the same destination register, the result is invalid.

For example, see [Example 2-11](#).

If both operations within a parallel instruction try to update the same destination register as shown in [Example 2-11](#) the assembler will issue an error.

Example 2-11. Invalid Destination Within a Parallel Instruction

```
; Invalid parallel instruction. Both operations use VR3 as a destination register
;
VCMPY VR3, VR2, VR1, VR0 ; 2p/1 instruction
|| VMOV32 VR3, mem32      ; <-- Invalid
```

2.5 Instruction Set

This section describes the assembly language instructions of the VCU. Also described are parallel operations, conditional operations, resource constraints, and addressing modes. The instructions listed here are independent from C28x and C28x+FPU instruction sets.

2.5.1 Instruction Descriptions

This section gives detailed information on the instruction set. Each instruction may present the following information:

- Operands
- Opcode
- Description
- Exceptions
- Pipeline
- Examples
- See also

The example INSTRUCTION is shown to familiarize you with the way each instruction is described. The example describes the kind of information you will find in each part of the individual instruction description and where to obtain more information. VCU instructions follow the same format as the C28x; the source operand(s) are always on the right and the destination operand(s) are on the left.

The explanations for the syntax of the operands used in the instruction descriptions for the C28x VCU are given in [Table 2-9](#).

Table 2-9. Operand Nomenclature

Symbol	Description
#16FHi	16-bit immediate (hex or float) value that represents the upper 16-bits of an IEEE 32-bit floating-point value. Lower 16-bits of the mantissa are assumed to be zero.
#16FHiHex	16-bit immediate hex value that represents the upper 16-bits of an IEEE 32-bit floating-point value. Lower 16-bits of the mantissa are assumed to be zero.
#16FLoHex	A 16-bit immediate hex value that represents the lower 16-bits of an IEEE 32-bit floating-point value
#32Fhex	32-bit immediate value that represents an IEEE 32-bit floating-point value
#32F	Immediate float value represented in floating-point representation
#0.0	Immediate zero
#5-bit	5-bit immediate unsigned value
addr	Opcode field indicating the addressing mode
Im(X), Im(Y)	Imaginary part of the input X or input Y
Im(Z)	Imaginary part of the output Z
Re(X), Re(Y)	Real part of the input X or input Y
Re(Z)	Real part of the output Z
mem16	Pointer (using any of the direct or indirect addressing modes) to a 16-bit memory location
mem32	Pointer (using any of the direct or indirect addressing modes) to a 32-bit memory location
VRa	VR0 - VR8 registers. Some instructions exclude VR8. Refer to the instruction description for details.
VR0H, VR1H...VR7H	VR0 - VR7 registers, high half.
VR0L, VR1L...VR7L	VR0 - VR7 registers, low half.
VT0, VT1	Transition bit register VT0 or VT1.
VSMn+1: VSMn	Pair of State Metric Registers (n = 0 : 62, n is even)
VRx.By	32 bit Aliased address space for each byte of the VRx registers (x=0:7,y =0:3)

Each instruction has a table that gives a list of the operands and a short description. Instructions always have their destination operand(s) first followed by the source operand(s).

Table 2-10. INSTRUCTION dest, source1, source2 Short Description

	Description
dest1	Description for the 1st operand for the instruction
source1	Description for the 2nd operand for the instruction
source2	Description for the 3rd operand for the instruction
Opcode	This section shows the opcode for the instruction
Description	Detailed description of the instruction execution is described. Any constraints on the operands imposed by the processor or the assembler are discussed.
Restrictions	Any constraints on the operands or use of the instruction imposed by the processor are discussed.
Pipeline	This section describes the instruction in terms of pipeline cycles as described in Section 2.4 .
Example	Examples of instruction execution. If applicable, register and memory values are given before and after instruction execution. Some examples are code fragments while other examples are full tasks that assume the VCU is correctly configured and the main CPU has passed it data.
Operands	Each instruction has a table that gives a list of the operands and a short description. Instructions always have their destination operand(s) first followed by the source operand(s).

2.5.2 General Instructions

The instructions are listed alphabetically, preceded by a summary.

Table 2-11. General Instructions

Title	Page
POP RB —Pop the RB Register from the Stack	160
PUSH RB —Push the RB Register onto the Stack	162
RPTB label, loc16 —Repeat A Block of Code	164
RPTB label, #RC —Repeat a Block of Code	166
VCLEAR VRa —Clear General Purpose Register	168
VCLEARALL —Clear All General Purpose and Transition Bit Registers	169
VCLRCPACK —Clears CPACK bit in the VSTATUS Register	170
VCLRCRCMSGFLIP —Clears CRCMSGFLIP bit in the VSTATUS Register	171
VCLROPACK —Clears OPACK bit in the VSTATUS Register	172
VCLROVFI —Clear Imaginary Overflow Flag	173
VCLROVFR —Clear Real Overflow Flag	174
VMOV16 mem16, VRaH —Store General Purpose Register, High Half	175
VMOV16 mem16, VRaL —Store General Purpose Register, Low Half	176
VMOV16 VRaH, mem16 —Load General Purpose Register, High Half	177
VMOV16 VRaL, mem16 —Load General Purpose Register, Low Half	178
VMOV32 *(0:16bitAddr), loc32 —Move the contents of loc32 to Memory	179
VMOV32 loc32, *(0:16bitAddr) —Move 32-bit Value from Memory to loc32	180
VMOV32 mem32, VRa —Store General Purpose Register	181
VMOV32 mem32, VSTATUS —Store VCU Status Register	182
VMOV32 mem32, VTa —Store Transition Bit Register	183
VMOV32 VRa, mem32 —Load 32-bit General Purpose Register	184
VMOV32 VRb, VRa —Move 32-bit Register to Register	185
VMOV32 VSTATUS, mem32 —Load VCU Status Register	186
VMOV32 VTa, mem32 —Load 32-bit Transition Bit Register	187
VMOVD32 VRa, mem32 —Load Register with Data Move	188
VMOVIX VRa, #16I —Load Upper Half of a General Purpose Register with I6-bit Immediate	189
VMOVZI VRa, #16I —Load General Purpose Register with Immediate	190
VMOVXI VRa, #16I —Load Low Half of a General Purpose Register with Immediate	191
VRNDOFF —Disable Rounding	192
VRNDON —Enable Rounding	193
VSATOFF —Disable Saturation	194
VSATON —Enable Saturation	195
VSETCPACK —Set CPACK bit in the VSTATUS Register	196
VSETCRCMSGFLIP —Set CRCMSGFLIP bit in the VSTATUS Register	197
VSETOPACK —Set OPACK bit in the VSTATUS Register	198
VSETSHL #5-bit —Initialize the Left Shift Value	199
VSETSHR #5-bit —Initialize the Left Shift Value	200
VSWAP32 VRb, VRa —32-bit Register Swap	201

POP RB ***Pop the RB Register from the Stack***

Operands

RB	repeat block register
----	-----------------------

Opcode LSW: 1111 1111 1111 0001

Description Restore the RB register from stack. If a high-priority interrupt contains a RPTB instruction, then the RB register must be stored on the stack before the RPTB block and restored after the RTPB block. In a low-priority interrupt RB must always be saved and restored. This save and restore must occur when interrupts are disabled.

Flags This instruction does not affect any flags in the VSTATUS register.

Pipeline This is a single-cycle instruction.

Example A high priority interrupt is defined as an interrupt that cannot itself be interrupted. In a high priority interrupt, the RB register must be saved if a RPTB block is used within the interrupt. If the interrupt service routine does not include a RPTB block, then you do not have to save the RB register.

```

; Repeat Block within a High-Priority Interrupt (Non-Interruptible)
;
; Interrupt:                ; RAS = RA, RA = 0
...
PUSH RB                    ; Save RB register only if a RPTB block is used in the ISR
...
...
RPTB _BlockEnd, AL        ; Execute the block AL+1 times
...
...
...
_BlockEnd                  ; End of block to be repeated
...
...
POP RB                     ; Restore RB register ...
IRET                       ; RA = RAS, RAS = 0

```

A low-priority interrupt is defined as an interrupt that allows itself to be interrupted. The RB register must always be saved and restored in a low-priority interrupt. The RB register must stored before interrupts are enabled. Likewise before restoring the RB register interrupts must first be disabled.

```

; Repeat Block within a Low-Priority Interrupt (Interruptible)
;
; Interrupt:                ; RAS = RA, RA = 0
...
PUSH RB                    ; Always save RB register
...
CLRC INTM                  ; Enable interrupts only after saving RB
...
...
; ISR may or may not include a RPTB block
...
...
SETC INTM                  ; Disable interrupts before restoring RB
...
POP RB                     ; Always restore RB register
...
IRET                       ; RA = RAS, RAS = 0

```

PUSH RB *Push the RB Register onto the Stack*

Operands

RB	repeat block register
----	-----------------------

Opcode LSW: 1111 1111 1111 0000

Description Save the RB register on the stack. If a high-priority interrupt contains a RPTB instruction, then the RB register must be stored on the stack before the RPTB block and restored after the RTPB block. In a low-priority interrupt RB must always be saved and restored. This save and restore must occur when interrupts are disabled.

Flags This instruction does not affect any flags in the VSTATUS register.

Pipeline This is a single-cycle instruction.

Example A high priority interrupt is defined as an interrupt that cannot itself be interrupted. In a high priority interrupt, the RB register must be saved if a RPTB block is used within the interrupt. If the interrupt service routine does not include a RPTB block, then you do not have to save the RB register.

```
; Repeat Block within a High-Priority Interrupt (Non-Interruptible)
;
; Interrupt:                ; RAS = RA, RA = 0
...
PUSH RB                    ; Save RB register only if a RPTB block is used in the ISR
...
...
RPTB _BlockEnd, AL        ; Execute the block AL+1 times
...
...
...
_BlockEnd                  ; End of block to be repeated
...
...
POP RB                     ; Restore RB register ...
IRET                      ; RA = RAS, RAS = 0
```

A low-priority interrupt is defined as an interrupt that allows itself to be interrupted. The RB register must always be saved and restored in a low-priority interrupt. The RB register must stored before interrupts are enabled. Likewise before restoring the RB register interrupts must first be disabled.

```
; Repeat Block within a Low-Priority Interrupt (Interruptible)
;
; Interrupt:                ; RAS = RA, RA = 0
...
PUSH RB                    ; Always save RB register
...
CLRC INTM                 ; Enable interrupts only after saving RB
...
...
; ISR may or may not include a RPTB block
...
...
SETC INTM                  ; Disable interrupts before restoring RB
...
POP RB                     ; Always restore RB register
...
IRET                      ; RA = RAS, RAS = 0
```

See also

[POP RB](#)
[RPTB label, loc16](#)
[RPTB label, #RC](#)

RPTB label, loc16 ***Repeat A Block of Code***
Operands

label	This label is used by the assembler to determine the end of the repeat block and to calculate RSIZE. This label should be placed immediately after the last instruction included in the repeat block.
loc16	16-bit location for the repeat count value.

Opcode

```
LSW: 1011 0101 0bbb bbbb
MSW: 0000 0000    loc16
```

Description

Initialize repeat block loop, repeat count from [loc16]

Restrictions

- The maximum block size is ≤ 127 16-bit words.
- An even aligned block must be ≥ 9 16-bit words.
- An odd aligned block must be ≥ 8 16-bit words.
- Interrupts must be disabled when saving or restoring the RB register.
- Repeat blocks cannot be nested.
- Any discontinuity type operation is not allowed inside a repeat block. This includes all call, branch or TRAP instructions. Interrupts are allowed.
- Conditional execution operations are allowed.

Flags

This instruction does not affect any flags in the VSTATUS register.

Pipeline

This instruction takes four cycles on the first iteration and zero cycles thereafter. No special pipeline alignment is required.

Example

The minimum size for the repeat block is 8 words if the block is even aligned and 9 words if the block is odd aligned. If you have a block of 8 words, as in the following example, you can make sure the block is odd aligned by proceeding it by a .align 2 directive and a NOP instruction. The .align 2 directive will make sure the NOP is even aligned. Since a NOP is a 16-bit instruction the RPTB will be odd aligned. For blocks of 9 or more words, this is not required.

```
; Repeat Block of 8 Words (Interruptible)
;
; Note: This example makes use of floating-point (C28x+FPU) instructions
;
;
; find the largest element and put its address in XAR6
    .align 2
    NOP
    RPTB _VECTOR_MAX_END, AR7
; Execute the block AR7+1 times
    MOVL ACC,XAR0 MOV32 R1H,*XAR0++    ; min size = 8, 9 words
    MAXF32 R0H,R1H                      ; max size = 127 words
    MOVST0 NF,ZF
    MOVL XAR6,ACC,LT
_VECTOR_MAX_END:                        ; label indicates the end
                                         ; RA is cleared
```

When an interrupt is taken the repeat active (RA) bit in the RB register is automatically copied to the repeat active shadow (RAS) bit. When the interrupt exits, the RAS bit is automatically copied back to the RA bit. This allows the hardware to keep track if a repeat loop was active whenever an interrupt is taken and restore that state automatically.

A high priority interrupt is defined as an interrupt that cannot itself be interrupted. In a high priority interrupt, the RB register must be saved if a RPTB block is used within the

interrupt. If the interrupt service routine does not include a RPTB block, then you do not have to save the RB register.

```
; Repeat Block within a High-Priority Interrupt (Non-Interruptible)
;
; Interrupt:                ; RAS = RA, RA = 0
...
PUSH RB                    ; Save RB register only if a RPTB block is used in the ISR
...
...
RPTB _BlockEnd, AL        ; Execute the block AL+1 times
...
...
...
_BlockEnd                  ; End of block to be repeated
...
...
POP RB                     ; Restore RB register ...
IRET                      ; RA = RAS, RAS = 0
```

A low-priority interrupt is defined as an interrupt that allows itself to be interrupted. The RB register must always be saved and restored in a low-priority interrupt. The RB register must stored before interrupts are enabled. Likewise before restoring the RB register interrupts must first be disabled.

```
; Repeat Block within a Low-Priority Interrupt (Interruptible)
;
; Interrupt:                ; RAS = RA, RA = 0
...
PUSH RB                    ; Always save RB register
...
CLR C INTM                 ; Enable interrupts only after saving RB
...
...
; ISR may or may not include a RPTB block
...
...
SETC INTM                  ; Disable interrupts before restoring RB
...
POP RB                     ; Always restore RB register
...
IRET                      ; RA = RAS, RAS = 0
```

RPTB label, #RC Repeat a Block of Code

Operands

label	This label is used by the assembler to determine the end of the repeat block and to calculate RSIZE. This label should be placed immediately after the last instruction included in the repeat block.
#RC	16-bit immediate value for the repeat count.

Opcode

```
LSW: 1011 0101 1bbb bbbb
MSW: cccc cccc cccc cccc
```

Description

Repeat a block of code. The repeat count is specified as a immediate value.

Restrictions

- The maximum block size is ≤ 127 16-bit words.
- An even aligned block must be ≥ 9 16-bit words.
- An odd aligned block must be ≥ 8 16-bit words.
- Interrupts must be disabled when saving or restoring the RB register.
- Repeat blocks cannot be nested.
- Any discontinuity type operation is not allowed inside a repeat block. This includes all call, branch or TRAP instructions. Interrupts are allowed.
- Conditional execution operations are allowed.

Flags

This instruction does not affect any flags in the VSTATUS register.

Pipeline

This instruction takes one cycle on the first iteration and zero cycles thereafter. No special pipeline alignment is required.

Example

The minimum size for the repeat block is 8 words if the block is even aligned and 9 words if the block is odd aligned. If you have a block of 8 words, as in the following example, you can make sure the block is odd aligned by proceeding it by a .align 2 directive and a NOP instruction. The .align 2 directive will make sure the NOP is even aligned. Since a NOP is a 16-bit instruction the RPTB will be odd aligned. For blocks of 9 or more words, this is not required.

```
; Repeat Block of 8 Words (Interruptible)
;
; Note: This example makes use of floating-point (C28x+FPU) instructions
;
; find the largest element and put its address in XAR6
;
    .align 2
    NOP
    RPTB _VECTOR_MAX_END, AR7
; Execute the block AR7+1 times
    MOVL ACC,XAR0 MOV32 R1H,*XAR0++    ; min size = 8, 9 words
    MAXF32 R0H,R1H                      ; max size = 127 words
    MOVST0 NF,ZF
    MOVL XAR6,ACC,LT
 VECTOR_MAX_END:                        ; label indicates the end
                                         ; RA is cleared
```

When an interrupt is taken the repeat active (RA) bit in the RB register is automatically copied to the repeat active shadow (RAS) bit. When the interrupt exits, the RAS bit is automatically copied back to the RA bit. This allows the hardware to keep track if a repeat loop was active whenever an interrupt is taken and restore that state automatically.

A high priority interrupt is defined as an interrupt that cannot itself be interrupted. In a high priority interrupt, the RB register must be saved if a RPTB block is used within the

interrupt. If the interrupt service routine does not include a RPTB block, then you do not have to save the RB register.

```
; Repeat Block within a High-Priority Interrupt (Non-Interruptible)
;
; Interrupt:                ; RAS = RA, RA = 0
...
PUSH RB                    ; Save RB register only if a RPTB block is used in the ISR
...
...
RPTB #_BlockEnd, #5        ; Execute the block AL+1 times
...
...
...
_BlockEnd                  ; End of block to be repeated
...
...
POP RB                     ; Restore RB register ...
IRET                       ; RA = RAS, RAS = 0
```

A low-priority interrupt is defined as an interrupt that allows itself to be interrupted. The RB register must always be saved and restored in a low-priority interrupt. The RB register must stored before interrupts are enabled. Likewise before restoring the RB register interrupts must first be disabled.

```
; Repeat Block within a Low-Priority Interrupt (Interruptible)
;
; Interrupt:                ; RAS = RA, RA = 0
...
PUSH RB                    ; Always save RB register
...
CLRRC INTM                 ; Enable interrupts only after saving RB
...
...
; ISR may or may not include a RPTB block
...
...
SETC INTM                  ; Disable interrupts before restoring RB
...
POP RB                     ; Always restore RB register
...
IRET                       ; RA = RAS, RAS = 0
```

VCLEAR VRa ***Clear General Purpose Register***
Operands

VRa	General purpose register: VR0, VR1... VR8
-----	---

Opcode

```
LSW: 1110 0110 1111 1000
MSW: 0000 0000 0000 aaaa
```

Description

Clear the specified general purpose register.

VRa = 0x00000000;

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

```
;
; Code fragment from a viterbi traceback
; For the first iteration the previous state metric must be
; initialized to zero (VR0).
;
    VCLEAR VR0                ; Clear the VR0 register
    MOVL XAR5,*+XAR4[0]       ; Point XAR5 to an array
;
; For first stage
;
    VMOV32 VT0, *--XAR3
    VMOV32 VT1, *--XAR3
    VTRACE *XAR5++,VR0,VT0,VT1 ; Uses VR0 (which is zero)
;
; etc...
;
```

VCLEARALL
Clear All General Purpose and Transition Bit Registers
Operands

none

Opcode

LSW: 1110 0110 1111 1001
MSW: 0000 0000 0000 0000

Description

Clear all of the general purpose registers (VR0, VR1... VR8) and the transition bit registers (VT0 and VT1).

```
VR0  = 0x00000000;
VR0  = 0x00000000;
VR2  = 0x00000000;
VR3  = 0x00000000;
VR4  = 0x00000000;
VR5  = 0x00000000;
VR6  = 0x00000000;
VR7  = 0x00000000;
VR8  = 0x00000000;
VT0  = 0x00000000;
VT1  = 0x00000000;
VSM0 = 0x00000000
VSM1 = 0x00000000
...
VSM63 = 0x00000000
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

```
;
; Context save all VCU VRa and VTa registers
;
VMOV32 *SP++, VR0
VMOV32 *SP++, VR1
VMOV32 *SP++, VR2
VMOV32 *SP++, VR3
VMOV32 *SP++, VR4
VMOV32 *SP++, VR5
VMOV32 *SP++, VR6
VMOV32 *SP++, VR7
VMOV32 *SP++, VR8
VMOV32 *SP++, VT0
VMOV32 *SP++, VT1
;
; Clear VR0 - VR8, VT0 and VT1, VSM0 - VSM63
;
VCLEARALL
;
; etc...
```

VCLRCPACK	<i>Clears CPACK bit in the VSTATUS Register</i>
Operands	none
Opcode	LSW: 1110 0101 0010 0010 MSW: 0000 0000 0000 0000
Description	Clears the CPACK bit in the VSTATUS register. This causes the VCU to process complex data, in complex math operations, in the VRx registers as follows: VRx[31:16] holds Real part, VRx[15:0] holds Imaginary part
Flags	This instruction clears the CPACK bit in the VSTATUS register.
Pipeline	This is a single-cycle instruction.
Example	<pre> ; complex conjugate multiply (jb + a)*(jd + c)=(ac+bd)+j(bc-ad) VCLRCPACK ; cpack = 0 real part in high word VMOV32 VR0, *XAR4++ ; load 1st complex input jb + a VMOV32 VR1, *XAR4++ ; load second complex input jd + c VCCMPY VR3, VR2, VR1, VR0 </pre>
See also	VSETCPACK

VCLRCRCMSGFLIP *Clears CRCMSGFLIP bit in the VSTATUS Register*

Operands

none

Opcode

LSW: 1110 0101 0010 1101
MSW: 0000 0000 0000 0000

Description

Clear the CRCMSGFLIP bit in the VSTATUS register. This causes the VCU to process message bits starting from most-significant to least-significant for CRC computation. In this case, bytes loaded from memory are fed directly for CRC computation.

Flags

This instruction clears the CRCMSGFLIP bit in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

```
; Clear the CRCMSGFLIP bit to have the CRC routine process the
; input message in big-endian format. The CRCMSGFLIP bit is
; cleared on reset
;
VCLRCRCMSGFLIP
LCR    _CRC_run8Bit
```

VCLROPACK	<i>Clears OPACK bit in the VSTATUS Register</i>
Operands	none
Opcode	LSW: 1110 0101 0010 0101 MSW: 0000 0000 0000 0000
Description	Clear the OPACK bit in the VSTATUS register. This bit affects the packing order of the traceback output bits (using the VTRACE instructions). When the bit is set to 0 it forces the bits generated from the traceback operation to be loaded through the LSb of the destination register (or memory location) with the older bits being left shifted.
Flags	This instruction clears the OPACK bit in the VSTATUS register.
Pipeline	This is a single-cycle instruction.
Example	
See also	VSETOPACK

VCLROVFI	<i>Clear Imaginary Overflow Flag</i>
Operands	none
Opcode	LSW: 1110 0101 0000 1011
Description	<p>Clear the real overflow flag in the VSTATUS register. To clear the real flag, use the VCLROVFR instruction. The imaginary flag bit can be set by instructions shown in Table 2-6. Refer to individual instruction descriptions for details.</p> <p>VSTATUS[OVFR] = 0;</p>
Flags	This instruction clears the OVFI flag.
Pipeline	This is a single-cycle instruction.
Example	
See also	VCLROVFR VRNDON VSATFOFF VSATON

VCLROVFR	<i>Clear Real Overflow Flag</i>
Operands	none
Opcode	LSW: 1110 0101 0000 1010
Description	<p>Clear the real overflow flag in the VSTATUS register. To clear the imaginary flag, use the VCLROVFI instruction. The imaginary flag bit can be set by instructions shown in Table 2-6. Refer to individual instruction descriptions for details.</p> <p>VSTATUS[OVFR] = 0;</p>
Flags	This instruction clears the OVFR flag.
Pipeline	This is a single-cycle instruction.
Example	
See also	VCLROVFI VRNDON VSATFOFF VSATON

VMOV16 mem16, VRaH *Store General Purpose Register, High Half*
Operands

mem16	Pointer to a 16-bit memory location. This will be the source for the VMOV16.
VRaH	High word of a general purpose register: VR0H, VR1H...VR8H.

Opcode

```
LSW: 1110 0010 0001 1000
MSW: 0001 aaaa mem16
```

Description

Store the upper 16-bits of the specified general purpose register into the 16-bit memory location.

```
[mem16] = VRa[31:6];
```

Flags

This instruction does not affect any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example
See also

[VMOV16 VRaH, mem16](#)

VMOV16 mem16, VRaL *Store General Purpose Register, Low Half*

Operands

mem16	Pointer to a 16-bit memory location. This will be the destination of the VMOV16.
VRaL	Low word of a general purpose register: VR0L, VR1L...VR8L.

Opcode

```
LSW: 1110 0010 0001 1000
MSW: 0000 aaaa mem16
```

Description

Store the low 16-bits of the specified general purpose register into the 16-bit memory location.

```
[mem16] = VRa[15:0];
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example
See also

[VMOV16 VRaL, mem16](#)

VMOV16 VRaH, mem16 *Load General Purpose Register, High Half*
Operands

VRHL	High word of a general purpose register: VR0H, VR1H....VR8H
mem16	Pointer to a 16-bit memory location. This will be the source for the VMOV16.

Opcode

```
LSW: 1110 0010 1100 1001
MSW: 0001 aaaa mem16
```

Description

Load the upper 16 bits of the specified general purpose register with the contents of memory pointed to by mem16.

```
VRa[31:16] = [mem16];
```

Flags

This instruction does not affect any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

```
;1st Iteration
VMOV32 VR4, *+XAR3[0]      ; VR4H = m, VR4L=n      Load m,n
VMOV16 VR0H, *+XAR5[0]     ; VR0H = J, VR0L = I      Init I, J
VMOV32 VR1, *+XAR3[4]      ; VR1H = u, VR1L = a      load u, a
VMOV32 VR6, VR0             ; Save current {J,I} in VR6
; etc.
```

See also

[VMOV16 mem16, VRaH](#)

VMOV16 VRaL, mem16 *Load General Purpose Register, Low Half*
Operands

VRaL	Low word of a general purpose register: VR0L, VR1L....VR8L
mem16	Pointer to a 16-bit memory location. This will be the source for the VMOV16.

Opcode

```
LSW: 1110 0010 1100 1001
MSW: 0000 aaaa mem16
```

Description

Load the lower 16 bits of the specified general purpose register with the contents of memory pointed to by mem16.

```
VRa[15:0] = [mem16];
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

```
;
; Loop will run 106 times for 212 inputs to decoder
;
; Code fragment from viterbi decoder
;
_LOOP:
;
;
; Calculate the branch metrics for code rate = 1/3
; Load VR0L, VR1L and VR2L with inputs
; to the decoder from the array pointed to by XAR5
;
;
    VMOV16 VR0L, *XAR5++
    VMOV16 VR1L, *XAR5++
    VMOV16 VR2L, *XAR5++
;
; VR0L = BM0
; VR0H = BM1
; VR1L = BM2
; VR1H = BM3
; VR2L = pt_old[0]
; VR2H = pt_old[1]
;
    VITBM3 VR0, VR1, VR2
    VMOV32 VR2, *XAR1++
; etc...
```

VMOV32 *(0:16bitAddr), loc32 *Move the contents of loc32 to Memory*
Operands

I*(0:16bitAddr)	Address of 32-bit Destination Location (VCU register)
loc32	Source Location (CPU register)

Opcode

```
LSW: 1011 1101 loc32
MSW: 1111 1111 1111 1111
```

Description

Move the 32-bit value in loc32 to the memory location addressed by 0:16bitAddr. The EALLOW bit in the ST1 register is ignored by this operation.
[0:16bitAddr] = [loc32]

Flags

This instruction does not affect any flags in the VSTATUS register.

Pipeline

This is a two-cycle instruction.

Example

```
; EALLOW ignored on write
; Four NOPs are needed after the operation so that the write to
; the VCU register takes effect before it is used in
; subsequent operations, for example
VMOV32 VRa,@ACC      ; VRa = ACC
NOP                   ; Pipeline alignment
NOP                   ; Pipeline alignment
NOP                   ; Pipeline alignment
NOP                   ; Pipeline alignment
VMOV32 *XAR7++, VRa   ; [*XAR] = VRa
```

[VMOV32 loc32, *\(0:16bitAddr\)](#)

VMOV32 loc32, *(0:16bitAddr) *Move 32-bit Value from Memory to loc32*

Operands

loc32	Destination Location (CPU register)
*(0:16bitAddr)	Address of 32-bit Source Value (VCU register)

Opcode

```
LSW: 1010 1111 loc32
MSW: 1111 1111 1111 1111
```

Description

Copy the 32-bit value referenced by 0:16bitAddr to the location indicated by loc32
[loc32] = [0:16bitAddr]

Flags

This instruction does not affect any flags in the VSTATUS register.

Pipeline

This is two-cycle instruction.

Example

```
; A single NOP is needed before the operation so as to read the
; correct VCU's VRx register value
VMOV32 VRa,*XAR7++ ; VRa = [*XAR7]
NOP                ; Pipeline alignment
VMOV32 @ACC, VRa   ; ACC = VRa
; Two NOPs are needed before the operation so as to read the
; correct VCU's VSMx or VRx.By register value.
VMOV32 VSM1: VSM0, *XAR7 ; VSM1:VSM0 = [*XAR7]
NOP                ; Pipeline alignment
NOP                ; Pipeline alignment
VMOV32 @ACC, VSM0   ; AH:AL = VSM1:VSM0
```

VMOV32 mem32, VRa *Store General Purpose Register*
Operands

mem32	Pointer to a 32-bit memory location. This will be the destination of the VMOV32.
VRa	General purpose register VR0, VR1... VR8

Opcode

```
LSW: 1110 0010 0000 0100
MSW: 0000 aaaa mem32
```

Description

Store the 32-bit contents of the specified general purpose register into the memory location pointed to by mem32.

```
[mem32] = VRa;
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

[VMOV32 VRa, mem32](#)
[VMOV32 VTa, mem32](#)

VMOV32 mem32, VSTATUS *Store VCU Status Register*
Operands

mem32	Pointer to a 32-bit memory location. This will be the destination of the VMOV32.
VSTATUS	VCU status register.

Opcode

```
LSW: 1110 0010 0000 1101
MSW: 0000 0000 mem32
```

Description

Store the VSTATUS register into the memory location pointed to by mem32.

```
[mem32] = VSTATUS;
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

VMOV32 mem32, VTa *Store Transition Bit Register*
Operands

mem32	pointer to a 32-bit memory location. This will be the destination of the VMOV32.
VTa	Transition bits register VT0 or VT1

Opcode

```
LSW: 1110 0010 0000 0101
MSW: 0000 00tt mem32
```

Description

Store the 32-bits of the specified transition bits register into the memory location pointed to by mem32.

```
[mem32] = VTa;
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

VMOV32 VRb, VRa *Move 32-bit Register to Register*
Operands

VRa	General purpose destination register VR0....VR8
VRb	General purpose source register VR0...VR8

Opcode

```
LSW: 1110 0110 1111 0010
MSW: 0000 0010 bbbb aaaa
```

Description

Move a 32-bit value from one general purpose VCU register to another.

```
VRa = [mem32];
```

Flags

This instruction does not affect any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

```
; Swap VR0 and VR1 using VR2 as temporary storage
;
VMOV32 VR2, VR1
VMOV32 VR1, VR0
VMOV32 VR0, VR2
```

VMOV32 VSTATUS, mem32 *Load VCU Status Register*

Operands

VSTATUS	VCU status register
mem32	Pointer to a 32-bit memory location. This will be the source of the VMOV32.

Opcode

```
LSW: 1110 0010 1011 0000
MSW: 0000 0000 mem32
```

Description

Load the VSTATUS register with the 32-bit value in memory pointed to by mem32.

```
VSTATUS = [mem32];
```

Flags

This instruction modifies all bits within the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example
See also

[VMOV32 mem32, VSTATUS](#)
[VMOV32 mem32, VTa](#)
[VMOV32 VRa, mem32](#)
[VMOV32 VTa, mem32](#)

VMOV32 VTa, mem32 *Load 32-bit Transition Bit Register*
Operands

VTa	Transition bit register: VT0, VT1
mem32	Pointer to a 32-bit memory location. This will be the source of the VMOV32.

Opcode

```
LSW: 1110 0011 1111 0001
MSW: 0000 00tt mem32
```

Description

Load the specified transition bit register with the 32-bit value in memory pointed to by mem32 .

```
VTa = [mem32];
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example
See also

VMOVD32 VRa, mem32 *Load Register with Data Move*

Operands

VRa	General purpose register, VR0, VR1.... VR8
mem32	Pointer to a 32-bit memory location. This will be the source of the VMOV32.

Opcode

```
LSW: 1110 0010 0010 0100
MSW: 0000 aaaa mem32
```

Description

Load the specified general purpose register with the 32-bit value in memory pointed to by mem32. In addition, copy the next 32-bit value in memory to the location pointed to by mem32.

```
VRa = [mem32];
[mem32 + 2] = [mem32];
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example
See also

VMOVIX VRa, #16I *Load Upper Half of a General Purpose Register with 16-bit Immediate*

Operands

VRa	General purpose register, VR0, VR1... VR8
#16I	16-bit immediate value

Opcode

```
LSW: 1110 0111 1110 IIII
MSW: IIII IIII IIII aaaa
```

Description

Load the upper 16-bits of the specified general purpose register with an immediate value. Leave the upper 16-bits of the register unchanged.

```
VRa[15:0] = unchanged;
VRa[31:16] = #16I;
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

[VMOVZI VRa, #16I](#)

VRNDOFF	<i>Disable Rounding</i>
Operands	none
Opcode	LSW: 1110 0101 0000 1001
Description	<p>This instruction disables the rounding mode by clearing the RND bit in the VSTATUS register. When rounding is disabled, the result of the shift right operation for addition and subtraction operations will be truncated instead of rounded. The operations affected by rounding are shown in Table 2-6. Refer to the individual instruction descriptions for information on how rounding effects the operation. To enable rounding use the VRNDON instruction.</p> <p>For more information on rounding, refer to Section 2.3.2.</p> <pre>VSTATUS[RND] = 0;</pre>
Flags	This instruction clears the RND bit in the VSTATUS register. It does not change any flags.
Pipeline	This is a single-cycle instruction.
Example	
See also	VCLROVFI VCLROVFR VRNDON VSATFOFF VSATON

VRNDON	<i>Enable Rounding</i>
Operands	none
Opcode	LSW: 1110 0101 0000 1000
Description	<p>This instruction enables the rounding mode by setting the RND bit in the VSTATUS register. When rounding is enabled, the result of the shift right operation for addition and subtraction operations will be rounded instead of being truncated. The operations affected by rounding are shown in Table 2-6. Refer to the individual instruction descriptions for information on how rounding effects the operation. To disable rounding use the VRNDOFF instruction.</p> <p>For more information on rounding, refer to Section 2.3.2.</p> <pre>VSTATUS[RND] = 1;</pre>
Flags	This instruction sets the RND bit in the VSTATUS register. It does not change any flags.
Pipeline	This is a single-cycle instruction.
Example	
See also	VCLROVFI VCLROVFR VRNDOFF VSATFOFF VSATON

VSATOFF	<i>Disable Saturation</i>
Operands	none
Opcode	LSW: 1110 0101 0000 0111
Description	<p>This instruction disables the saturation mode by clearing the SAT bit in the VSTATUS register. When saturation is disabled, results of addition and subtraction are allowed to overflow or underflow. When saturation is enabled, results will instead be set to a maximum or minimum value instead of being allowed to overflow or underflow. To enable saturation use the VSATON instruction.</p> <p>VSTATUS[SAT] = 0</p>
Flags	This instruction clears the the SAT bit in the VSTATUS register. It does not change any flags.
Pipeline	This is a single-cycle instruction.
Example	
See also	VCLROVFI VCLROVFR VRNDOFF VRNDON VSATON

VSATON	<i>Enable Saturation</i>
Operands	none
Opcode	LSW: 1110 0101 0000 0110
Description	<p>This instruction enables the saturation mode by setting the SAT bit in the VSTATUS register. When saturation is enables, results of addition and subtraction are not allowed to overflow or underflow. Results will, instead, be set to a maximum or minimum value. To disable saturation use the VSATOFF instruction..</p> <p>VSTATUS[SAT] = 1</p>
Flags	This instruction sets the SAT bit in the VSTATUS register. It does not change any flags.
Pipeline	This is a single-cycle instruction.
Example	
See also	VCLROVFI VCLROVFR VRNDOFF VRNDON VSATOFF

VSETCPACK	<i>Set CPACK bit in the VSTATUS Register</i>
Operands	none
Opcode	LSW: 1110 0101 0010 0001 MSW 0000 0000 0000 0000
Description	Set the CPACK bit in the VSTATUS register. This causes the VCU to process complex data, in complex math operations, in the VRx registers as follows: VRx[31:16] holds the Imaginary part, VRx[15:0] holds the Real part
Flags	This instruction sets the CPACK bit in the VSTATUS register.
Pipeline	This is a single-cycle instruction.
Example	<pre> ; complex conjugate multiply (a + jb)*(c + jd)=(ac+bd)+j(bc-ad) VSETCPACK ; cpack = 1 imag part in low word VMOV32 VR0, *XAR4++ ; load 1st complex input a + jb VMOV32 VR1, *XAR4++ ; load second complex input c + jd VCCMPY VR3, VR2, VR1, VR0 </pre>
See also	VCLRCPACK

VSETCRCMSGFLIP Set CRCMSGFLIP bit in the VSTATUS Register

Operands

none

Opcode

LSW: 1110 0101 0010 1100
MSW 0000 0000 0000 0000

Description

Set the CRCMSGFLIP bit in the VSTATUS register. This causes the VCU to process message bits starting from least-significant to most-significant for CRC computation. In this case, bytes loaded from memory are “flipped” and then fed for CRC computation.

Flags

This instruction sets the CRCMSGFLIP bit in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

```
; Set the CRCMSGFLIP bit, each word has all its bits reversed
; prior to the CRC being calculated
;
VSETCRCMSGFLIP
LCR    _CRC_run8Bit
VCLRCRCMSGFLIP
```

See also

[VCLRCRCMSGFLIP](#)

VSETOPACK	<i>Set OPACK bit in the VSTATUS Register</i>
Operands	none
Opcode	LSW: 1110 0101 0010 0011 MSW 0000 0000 0000 0000
Description	Set the OPACK bit in the VSTATUS register. This bit affects the packing order of the traceback output bits (using the instructions). When the bit is set to 1 it forces the bits generated from the traceback operation to be loaded through the MSb of the destination register (or memory location) with the older bits being right-shifted. This instruction sets the OPACK bit in the VSTATUS register.
Flags	This instruction sets the OPACK bit in the VSTATUS register.
Pipeline	This is a single-cycle instruction.
Example	<pre> VSETOPACK ; VSTATUS.OPACK = 1, start packing the decoded ; bits from trace back into VT1 starting from the ; MSb, this obviates the need to manually flip the ; result each time ; etc... </pre>
See also	VCLROPACK

VSETSHL #5-bit *Initialize the Left Shift Value*
Operands

#5-bit	5-bit, unsigned, immediate value
--------	----------------------------------

Opcode

LSW: 1110 0101 110s ssss

Description

Load VSTATUS[SHIFTL] with an unsigned, 5-bit, immediate value. The left shift value specifies the number of bits an operand is shifted by. A value of zero indicates no shift will be performed. The left shift is used by the and VCDSUB16 and VCDADD16 operations. Refer to the description of these instructions for more information. To load the right shift value use the [VSETSHR #5-bit](#) instruction.

VSTATUS[VSHIFTL] = #5-bit

Flags

This instruction changes the VSHIFTL value in the VSTATUS register. It does not change any flags.

Pipeline

This is a single-cycle instruction.

Example
See also
[VSETSHR #5-bit](#)

VSETSHR #5-bit *Initialize the Left Shift Value*

Operands

#5-bit	5-bit, unsigned, immediate value
--------	----------------------------------

Opcode

LSW: 1110 0101 010s ssss

Description

Load VSTATUS[SHIFTR] with an unsigned, 5-bit, immediate value. The right shift value specifies the number of bits an operand is shifted by. A value of zero indicates no shift will be performed. The right shift is used by the VCADD, VCSUB, VCDADD16 and VCDSUB16 operations. It is also used by the addition portion of the VCMAC. Refer to the description of these instructions for more information.

VSTATUS[VSHIFTR] = #5-bit

Flags

This instruction changes the VSHIFTR value in the VSTATUS register. It does not change any flags.

Pipeline

This is a single-cycle instruction.

Example
See also
[VSETSHL #5-bit](#)

VSWAP32 VRb, VRa 32-bit Register Swap
Operands

VRb	General purpose register VR0...VR8
VRa	General purpose register VR0...VR8

Opcode

```
LSW: 1110 0110 1111 0010
MSW: 0000 0011 bbbb aaaa
```

Description

Swap the contents of the 32-bit general purpose VCU registers VRa and VRb.

Flags

This instruction does not affect any flags in the VSTATUS register

Pipeline

This is a single-cycle instruction.

Example

```
; Swap VR0 and VR1 using VSWAP32 instruction
;
```

2.5.3 Arithmetic Math Instructions

The instructions are listed alphabetically, preceded by a summary.

Table 2-12. Arithmetic Math Instructions

Title	Page
VASHL32 VRa<<#5-bit — Arithmetic Shift Left.....	203
VASHR32 VRa>>#5-bit — Arithmetic Shift Right.....	204
VBITFLIP VRa — Bit Flip.....	205
VLSHL32 VRa<<#5-bit — Logical Shift Left.....	206
VLSHR32 VRa>>#5-bit — Logical Shift Right.....	207
VNEG VRa — Two's Complement Negate.....	208

VASHL32 VRa<<#5-bit *Arithmetic Shift Left*

Operands

VRa	VRa can be VR0 - VR7. VRa can not be VR8.
#5-bit	5-bit unsigned immediate value

Opcode

```
LSW: 1110 0110 1111 0010
MSW: 0000 0111 IIII Iaaa
```

Description

Arithmetic left shift of VRa

```
If(VSTATUS[SAT] == 1){
    VRa = sat(VRa << #5-bit Immediate)
}else {
    VRa = VRa << #5-bit Immediate
}
```

Flags

This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if the 32-bit signed result after the shift left operation overflows

Pipeline

This is a single-cycle instruction

Example

```
VASHL32    VR4 << #16 ; VR4 := VR4 << 16
```

VASHR32 VRa>>#5-bit Arithmetic Shift Right
Operands

VRa	VRa can be VR0 - VR7. VRa can not be VR8.
#5-bit	5-bit unsigned immediate value

Opcode

```
LSW: 1110 0110 1111 0010
MSW: 0000 0110 IIII Iaaa
```

Description

Arithmetic right shift of VRa

```
If(VSTATUS[RND] == 1){
    VRa = rnd(VRa >> #5-bit Immediate)
}else {
    VRa = VRa >> #5-bit Immediate
}
```

Flags

This instruction does not affect any flags in the VSTATUS register

Pipeline

This is a single-cycle instruction

Example

```
VASHR32    VR1 >> #16 ; VR1 := VR1 >> 16 (sign extended)
```

VCSHR16 VRa << #4-bit — Complex Shift Right.....	264
VCSUB VR5, VR4, VR3, VR2 — Complex 32 - 32 = 32 Subtraction	265
VCSUB VR5, VR4, VR3, VR2 VMOV32 VRa, mem32 — Complex Subtraction	267

VCADD VR5, VR4, VR3, VR2 *Complex 32 + 32 = 32 Addition*
Operands

Before the operation, the inputs should be loaded into registers as shown below. Each operand for this instruction includes a 32-bit real and a 32-bit imaginary part.

Input Register	Value
VR5	32-bit integer representing the real part of the first input: Re(X)
VR4	32-bit integer representing the imaginary part of the first input: Im(X)
VR3	32-bit integer representing the real part of the 2nd input: Re(Y)
VR2	32-bit integer representing the imaginary part of the 2nd input: Im(Y)

The result is also a complex number with a 32-bit real and a 32-bit imaginary part. The result is stored in VR5 and VR4 as shown below:

Output Register	Value
VR5	32-bit integer representing the real part of the result: $\text{Re}(Z) = \text{Re}(X) + (\text{Re}(Y) \gg \text{SHIFTR})$
VR4	32-bit integer representing the imaginary part of the result: $\text{Im}(Z) = \text{Im}(X) + (\text{Im}(Y) \gg \text{SHIFTR})$

Opcode

LSW: 1110 0101 0000 0010

Description

Complex 32 + 32 = 32-bit addition operation.

The second input operand (stored in VR3 and VR2) is shifted right by VSTATUS[SHIFR] bits before the addition. If VSTATUS[RND] is set, then bits shifted out to the right are rounded, otherwise these bits are truncated. The rounding operation is described in [Section 2.3.2](#). If the VSTATUS[SAT] bit is set, then the result will be saturated in the event of an overflow or underflow.

```
// RND    is VSTATUS[RND]
// SAT    is VSTATUS[SAT]
// SHIFTR is VSTATUS[SHIFTR]
//
// X:  VR5 = Re(X)    VR4 = Im(X)
// Y:  VR3 = Re(Y)    VR2 = Im(Y)
//
// Calculate Z = X + Y
//
    if (RND == 1)
    {
        VR5 = VR5 + round(VR3 >> SHIFTR); // Re(Z)
        VR4 = VR4 + round(VR2 >> SHIFTR); // Im(Z)
    }
    else
    {
        VR5 = VR5 + (VR3 >> SHIFTR);      // Re(Z)
        VR4 = VR4 + (VR2 >> SHIFTR);      // Im(Z)
    }
    if (SAT == 1)
    {
        sat32(VR5);
        sat32(VR4);
    }
```

Flags

This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if the VR5 computation (real part) overflows or underflows.
- OVFI is set if the VR4 computation (imaginary part) overflows or underflows.

Pipeline

This is a single-cycle instruction.

VSETSHR #5-bit

VCADD VR5, VR4, VR3, VR2 || VMOV32 VRa, mem32 *Complex 32+32 = 32 Add with Parallel Load*
Operands

Before the operation, the inputs should be loaded into registers as shown below. Each complex number includes a 32-bit real and a 32-bit imaginary part.

Input Register	Value
VR5	32-bit integer representing the real part of the first input: Re(X)
VR4	32-bit integer representing the imaginary part of the first input: Im(X)
VR3	32-bit integer representing the real part of the 2nd input: Re(Y)
VR2	32-bit integer representing the imaginary part of the 2nd input: Im(Y)
mem32	pointer to a 32-bit memory location

The result is also a complex number with a 32-bit real and a 32-bit imaginary part. The result is stored in VR5 and VR4 as shown below:

Output Register	Value
VR5	32-bit integer representing the real part of the result: $\text{Re}(Z) = \text{Re}(X) + (\text{Re}(Y) \gg \text{SHIFTR})$
VR4	32-bit integer representing the imaginary part of the result: $\text{Im}(Z) = \text{Im}(X) + (\text{Im}(Y) \gg \text{SHIFTR})$
VRa	contents of the memory pointed to by [mem32]. VRa can not be VR5, VR4 or VR8.

Opcode

```
LSW: 1110 0011 1111 1000
MSW: 0000 aaaa mem32
```

Description

Complex 32 + 32 = 32-bit addition operation with parallel register load.

The second input operand (stored in VR3 and VR2) is shifted right by VSTATUS[SHIFR] bits before the addition. If VSTATUS[RND] is set, then bits shifted out to the right are rounded, otherwise these bits are truncated. The rounding operation is described in [Section 2.3.2](#). If the VSTATUS[SAT] bit is set, then the result will be saturated in the event of an overflow or underflow.

In parallel with the addition, VRa is loaded with the contents of memory pointed to by mem32.

```
// RND    is VSTATUS[RND]
// SAT    is VSTATUS[SAT]
// SHIFTR is VSTATUS[SHIFTR]
//
// VR5 = Re(X)    VR4 = Im(X)
// VR3 = Re(Y)    VR2 = Im(Y)
//
// Z = X + Y
//
    if (RND == 1)
    {
        VR5 = VR5 + round(VR3 >> SHIFTR); // Re(Z)
        VR4 = VR4 + round(VR2 >> SHIFTR); // Im(Z)
    }
    else
    {
        VR5 = VR5 + (VR3 >> SHIFTR);      // Re(Z)
        VR4 = VR4 + (VR2 >> SHIFTR);      // Im(Z)
    }
    if (SAT == 1)
    {
        sat32(VR5);
        sat32(VR4);
    }
    VRa = [mem32];
```

Flags

This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if the VR5 computation (real part) overflows.
- OVFI is set if the VR4 computation (imaginary part) overflows.

Pipeline

Both operations complete in a single cycle (1/1 cycles).

VCMAC VR5, VR4, VR3, VR2, VR1, VR0 *Complex Conjugate Multiply and Accumulate*
Operands

Input Register ⁽¹⁾	Value
VR0	First Complex Operand
VR1	Second Complex Operand
VR2	Imaginary part of the Result
VR3	Real part of the Result
VR4	Imaginary part of the accumulation
VR5	Real part of the accumulation

⁽¹⁾ The user will need to do one final addition to accumulate the final multiplications (Real-VR3 and Imaginary-VR2) into the result registers.

Opcode

```
LSW: 1110 0101 0000 1110
```

Description
Complex Conjugate Multiply Operation

```
// VR5 = Accumulation of the real part
// VR4 = Accumulation of the imaginary part
//
// VR0 = X + jX: VR0[31:16] = X, VR0[15:0] = jX
// VR1 = Y + jY: VR1[31:16] = Y, VR1[15:0] = jY
//
// Perform add
//
if (RND == 1)
{
    VR5 = VR5 + round(VR3 >> SHIFTR);
    VR4 = VR4 + round(VR2 >> SHIFTR);
}
else
{
    VR5 = VR5 + (VR3 >> SHIFTR);
    VR4 = VR4 + (VR2 >> SHIFTR);
}
//
// Perform multiply (X + jX) * (Y - jY)
//
if(VSTATUS[CPACK] == 0){
    VR3 = VR0H * VR1H + VR0L * VR1L; Real result
    VR2 = VR0H * VR1L - VR0L * VR1H; Imaginary result
}
else
{
    VR3 = VR0L * VR1L + VR0H * VR1H; Real result
    VR2 = VR0L * VR1H - VR0H * VR1L; Imaginary result
}
if(SAT == 1)
{
    sat32(VR3);
    sat32(VR2);
}
```

Flags

This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if the VR3 computation (real part) overflows or underflows.
- OVFI is set if the VR2 computation (imaginary part) overflows or underflows.

Pipeline

This is a 2p-cycle instruction.

VCMAC VR7, VR6, VR5, VR4, mem32, *XAR7++ *Complex Multiply and Accumulate*

Operands The VMAC alternates which registers are used between each cycle. For odd cycles (1, 3, 5, and so on) the following registers are used:

Odd Cycle Input	Value
VR5	Previous real-part total accumulation: $\text{Re}(\text{odd_sum})$
VR4	Previous imaginary-part total accumulation: $\text{Im}(\text{odd_sum})$
VR1	Previous real result from the multiply: $\text{Re}(\text{odd_mpy})$
VR0	Previous imaginary result from the multiply $\text{Im}(\text{odd_mpy})$
[mem32]	Pointer to a 32-bit memory location representing the first input to the multiply If(VSTATUS[CPACK] == 0) [mem32][32:16] = $\text{Re}(X)$ [mem32][15:0] = $\text{Im}(X)$ If(VSTATUS[CPACK] == 1) [mem32][32:16] = $\text{Im}(X)$ mem32[15:0] = $\text{Re}(X)$
XAR7	Pointer to a 32-bit memory location representing the second input to the multiply If(VSTATUS[CPACK] == 0) *XAR7[32:16] = $\text{Re}(X)$ *XAR7[15:0] = $\text{Im}(X)$ If(VSTATUS[CPACK] == 1) *XAR7[32:16] = $\text{Im}(X)$ *XAR7 [15:0] = $\text{Re}(X)$

The result from odd cycle is stored as shown below:

Odd Cycle Output	Value
VR5	32-bit real part of the total accumulation $\text{Re}(\text{odd_sum}) = \text{Re}(\text{odd_sum}) + \text{Re}(\text{odd_mpy})$
VR4	32-bit imaginary part of the total accumulation $\text{Im}(\text{odd_sum}) = \text{Im}(\text{odd_sum}) + \text{Im}(\text{odd_mpy})$
VR1	32-bit real result from the multiplication: $\text{Re}(Z) = \text{Re}(X)*\text{Re}(Y) - \text{Im}(X)*\text{Im}(Y)$
VR0	32-bit imaginary result from the multiplication: $\text{Im}(Z) = \text{Re}(X)*\text{Im}(Y) + \text{Re}(Y)*\text{Im}(X)$

For even cycles (2, 4, 6, and so on) the following registers are used:

Even Cycle Input	Value
VR7	Previous real-part total accumulation: $\text{Re}(\text{even_sum})$
VR6	Previous imaginary-part total accumulation: $\text{Im}(\text{even_sum})$
VR3	Previous real result from the multiply: $\text{Re}(\text{even_mpy})$
VR2	Previous imaginary result from the multiply $\text{Im}(\text{even_mpy})$
[mem32]	Pointer to a 32-bit memory location representing the first input to the multiply If(VSTATUS[CPACK] == 0) [mem32][32:16] = $\text{Re}(X)$ [mem32][15:0] = $\text{Im}(X)$ If(VSTATUS[CPACK] == 1) [mem32][32:16] = $\text{Im}(X)$

Even Cycle Input Value

	mem32[[15:0] = Re(X)
XAR7	Pointer to a 32-bit memory location representing the second input to the multiply
	If(VSTATUS[CPACK] == 0)
	*XAR7[32:16] = Re(X)
	*XAR7[15:0] = Im(X)
	If(VSTATUS[CPACK] == 1)
	*XAR7[32:16] = Im(X)
	*XAR7 [15:0] = Re(X)

The result from even cycles is stored as shown below:

Even Cycle Output Value

VR7	32-bit real part of the total accumulation $\text{Re}(\text{even_sum}) = \text{Re}(\text{even_sum}) + \text{Re}(\text{even_mpy})$
VR6	32-bit imaginary part of the total accumulation $\text{Im}(\text{even_sum}) = \text{Im}(\text{even_sum}) + \text{Im}(\text{even_mpy})$
VR3	32-bit real result from the multiplication: $\text{Re}(Z) = \text{Re}(X) * \text{Re}(Y) - \text{Im}(X) * \text{Im}(Y)$
VR2	32-bit imaginary result from the multiplication: $\text{Im}(Z) = \text{Re}(X) * \text{Im}(Y) + \text{Re}(Y) * \text{Im}(X)$

Opcode

```
LSW: 1110 0010 0101 0000
MSW: 00bb baaa mem32
```

Description

Perform a repeated multiply and accumulate operation. This instruction must be used with the repeat instruction (RPT|). The destination of the accumulate will alternate between VR7/VR6 and VR5/VR4 on each cycle.

```
// Cycle 1:
//
// Perform accumulate
//
if(RND == 1)
{
    VR5 = VR5 + round(VR1 >> SHIFTR)
    VR4 = VR4 + round(VR0 >> SHIFTR)
}
else
{
    VR5 = VR5 + (VR1 >> SHIFTR)
    VR4 = VR4 + (VR0 >> SHIFTR)
}
//
// X and Y array element 0
//
VR1 = Re(X)*Re(Y) - Im(X)*Im(Y)
VR0 = Re(X)*Im(Y) + Re(Y)*Im(X)
//
// Cycle 2:
//
// Perform accumulate
//
if(RND == 1)
{
    VR7 = VR7 + round(VR3 >> SHIFTR)
    VR6 = VR6 + round(VR2 >> SHIFTR)
}
else
{

```

```

        VR7 = VR7 + (VR3 >> SHIFTR)
        VR6 = VR6 + (VR2 >> SHIFTR)
    }
    //
    // X and Y array element 1
    //
    VR3 = Re(X)*Re(Y) - Im(X)*Im(Y)
    VR2 = Re(X)*Im(Y) + Re(Y)*Im(X)
//
// Cycle 3:
//
// Perform accumulate
//
    if(RND == 1)
    {
        VR5 = VR5 + round(VR1 >> SHIFTR)
        VR4 = VR4 + round(VR0 >> SHIFTR)
    }
    else
    {
        VR5 = VR5 + (VR1 >> SHIFTR)
        VR4 = VR4 + (VR0 >> SHIFTR)
    }
    //
    // X and Y array element 2
    //
    VR1 = Re(X)*Re(Y) - Im(X)*Im(Y)
    VR0 = Re(X)*Im(Y) + Re(Y)*Im(X)
    etc...

```

Restrictions VR0, VR1, VR2, and VR3 will be used as temporary storage by this instruction.

Flags The VSTATUS register flags are modified as follows:

- OVFR is set in the case of an overflow or underflow of the addition or subtraction operations.
- OVFI is set in the case an overflow or underflow of the imaginary part of the addition or subtraction operations.

Pipeline The VCCMAC takes $2p + N$ cycles where N is the number of times the instruction is repeated. This instruction has the following pipeline restrictions:

```

<<instruction1>>           ; No restrictions
<<instruction2>>           ; Cannot be a 2p instruction that writes
                           ; to VR0, VR1...VR7 registers
RPT #(N-1)                 ; Execute N times, where N is even
|| VCMAC VR7, VR6, VR5, VR4, *XAR6++, *XAR7++
<<instruction3>>           ; No restrictions
                           ; Can read VR0, VR1...VR8

```

Example Cascading of RPT || VCMAC is allowed as long as the first and subsequent counts are even. Cascading is useful for creating interruptible windows so that interrupts are not delayed too long by the RPT instruction. For example:

```

;
; Example of cascaded VMAC instructions
;
    VCLEARALL             ; Zero the accumulation registers
;
; Execute MACF32 N+1 (4) times
;
    RPT #3
|| VCMAC VR7, VR6, VR5, VR4, *XAR6++, *XAR7++
;
; Execute MACF32 N+1 (6) times
;

```

```

RPT #5
|| VCMAC VR7, VR6, VR5, VR4, *XAR6++, *XAR7++
;
; Repeat MACF32 N+1 times where N+1 is even
;

RPT #N
|| MACF32 R7H, R3H, *XAR6++, *XAR7++
ADDF32 VR7, VR6, VR5, VR4

```

VCCMAC VR5, VR4, VR3, VR2, VR1, VR0 || VMOV32 VRa, mem32 *Complex Conjugate Multiply and Accumulate with Parallel Load*

Operands

Input Register	Value
VR0	First Complex Operand
VR1	Second Complex Operand
VR2	Imaginary part of the Result
VR3	Real part of the Result
VR4	Imaginary part of the accumulation
VR5	Real part of the accumulation
VRa	Contents of the memory pointed to by mem32. VRa cannot be VR5, VR4 or VR8
mem32	Pointer to 32-bit memory location

Note: The user will need to do one final addition to accumulate the final multiplications (Real-VR3 and Imaginary-VR2) into the result registers.

Opcode

LSW: 1110 0101 0000 1110
MSW: 0001 aaaa mem32

Description

Complex Conjugate Multiply Operation with parallel load.

```
// VR5 = Accumulation of the real part
// VR4 = Accumulation of the imaginary part
//
// VR0 = X + jX: VR0[31:16] = X, VR0[15:0] = jX
// VR1 = Y + jY: VR1[31:16] = Y, VR1[15:0] = jY
//
// Perform add
//
if (RND == 1)
{
    VR5 = VR5 + round(VR3 >> SHIFTR);
    VR4 = VR4 + round(VR2 >> SHIFTR);
}
else
{
    VR5 = VR5 + (VR3 >> SHIFTR);
    VR4 = VR4 + (VR2 >> SHIFTR);
}
//
// Perform multiply (X + jX) * (Y - jY)
//
If(VSTATUS[CPACK] == 0){
    VR3 = VR0H * VR1H + VR0L * VR1L; Real result
    VR2 = VR0H * VR1L - VR0L * VR1H; Imaginary result
}
else
{
    VR3 = VR0L * VR1L + VR0H * VR1H; Real result
    VR2 = VR0L * VR1H - VR0H * VR1L; Imaginary result
}
if(SAT == 1)
{
    sat32(VR3);
    sat32(VR2);
}
VRa = [mem32];
```

Flags

This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if the VR3 computation (real part) overflows or underflows.
- OVFI is set if the VR2 computation (imaginary part) overflows or underflows.

Pipeline

This is a 2p-cycle instruction.

VCCMAC VR7, VR6, VR5, VR4, mem32, *XAR7++ *Complex Conjugate Multiply and Accumulate*

Operands The VMAC alternates which registers are used between each cycle. For odd cycles (1, 3, 5, and so on) the following registers are used:

Odd Cycle Input	Value
VR5	Previous real-part total accumulation: $\text{Re}(\text{odd_sum})$
VR4	Previous imaginary-part total accumulation: $\text{Im}(\text{odd_sum})$
VR1	Previous real result from the multiply: $\text{Re}(\text{odd_mpy})$
VR0	Previous imaginary result from the multiply $\text{Im}(\text{odd_mpy})$
[mem32]	Pointer to a 32-bit memory location representing the first input to the multiply $\text{If}(\text{VSTATUS}[\text{CPACK}] == 0)$ $[\text{mem32}][32:16] = \text{Re}(X)$ $[\text{mem32}][15:0] = \text{Im}(X)$ $\text{If}(\text{VSTATUS}[\text{CPACK}] == 1)$ $[\text{mem32}][32:16] = \text{Im}(X)$ $[\text{mem32}][15:0] = \text{Re}(X)$
XAR7	Pointer to a 32-bit memory location representing the second input to the multiply $\text{If}(\text{VSTATUS}[\text{CPACK}] == 0)$ $*\text{XAR7}[32:16] = \text{Re}(X)$ $*\text{XAR7}[15:0] = \text{Im}(X)$ $\text{If}(\text{VSTATUS}[\text{CPACK}] == 1)$ $*\text{XAR7}[32:16] = \text{Im}(X)$ $*\text{XAR7}[15:0] = \text{Re}(X)$

The result from the odd cycle is stored as shown below:

Odd Cycle Output	Value
VR5	32-bit real part of the total accumulation $\text{Re}(\text{odd_sum}) = \text{Re}(\text{odd_sum}) + \text{Re}(\text{odd_mpy})$
VR4	32-bit imaginary part of the total accumulation $\text{Im}(\text{odd_sum}) = \text{Im}(\text{odd_sum}) + \text{Im}(\text{odd_mpy})$
VR1	32-bit real result from the multiplication: $\text{Re}(Z) = \text{Re}(X)*\text{Re}(Y) + \text{Im}(X)*\text{Im}(Y)$
VR0	32-bit imaginary result from the multiplication: $\text{Im}(Z) = \text{Re}(X)*\text{Im}(Y) - \text{Re}(Y)*\text{Im}(X)$

For even cycles (2, 4, 6, and so on) the following registers are used:

Even Cycle Input	Value
VR7	Previous real-part total accumulation: $\text{Re}(\text{even_sum})$
VR6	Previous imaginary-part total accumulation: $\text{Im}(\text{even_sum})$
VR3	Previous real result from the multiply: $\text{Re}(\text{even_mpy})$
VR2	Previous imaginary result from the multiply $\text{Im}(\text{even_mpy})$
[mem32]	Pointer to a 32-bit memory location representing the first input to the multiply $\text{If}(\text{VSTATUS}[\text{CPACK}] == 0)$ $[\text{mem32}][32:16] = \text{Re}(X)$ $[\text{mem32}][15:0] = \text{Im}(X)$ $\text{If}(\text{VSTATUS}[\text{CPACK}] == 1)$ $[\text{mem32}][32:16] = \text{Im}(X)$

Even Cycle Input Value

	mem32[[15:0] = Re(X)
XAR7	Pointer to a 32-bit memory location representing the second input to the multiply
	If(VSTATUS[CPACK] == 0)
	*XAR7[32:16] = Re(X)
	*XAR7[15:0] = Im(X)
	If(VSTATUS[CPACK] == 1)
	*XAR7[32:16] = Im(X)
	*XAR7 [15:0] = Re(X)

The result from even cycles is stored as shown below:

Even Cycle Output Value

VR7	32-bit real part of the total accumulation $\text{Re}(\text{even_sum}) = \text{Re}(\text{even_sum}) + \text{Re}(\text{even_mpy})$
VR6	32-bit imaginary part of the total accumulation $\text{Im}(\text{even_sum}) = \text{Im}(\text{even_sum}) + \text{Im}(\text{even_mpy})$
VR3	32-bit real result from the multiplication: $\text{Re}(Z) = \text{Re}(X) * \text{Re}(Y) + \text{Im}(X) * \text{Im}(Y)$
VR2	32-bit imaginary result from the multiplication: $\text{Im}(Z) = \text{Re}(X) * \text{Im}(Y) - \text{Re}(Y) * \text{Im}(X)$

Opcode

```
LSW: 1110 0010 0101 0001
MSW: 0010 1111 mem32
```

Description

Perform a repeated complex conjugate multiply and accumulate operation. This instruction must be used with the single repeat instruction (RPT ||). The destination of the accumulate will alternate between VR7/VR6 and VR5/VR4 on each cycle.

```
// Cycle 1:
//
// Perform accumulate
//
if(RND == 1)
{
    VR5 = VR5 + round(VR1 >> SHIFTR)
    VR4 = VR4 + round(VR0 >> SHIFTR)
}
else
{
    VR5 = VR5 + (VR1 >> SHIFTR)
    VR4 = VR4 + (VR0 >> SHIFTR)
}
//
// X and Y array element 0
//
VR1 = Re(X) * Re(Y) + Im(X) * Im(Y)
VR0 = Re(X) * Im(Y) - Re(Y) * Im(X)
//
// Cycle 2:
//
// Perform accumulate
//
if(RND == 1)
{
    VR7 = VR7 + round(VR3 >> SHIFTR)
    VR6 = VR6 + round(VR2 >> SHIFTR)
}
```

```

else
{
VR7 = VR7 + (VR3 >> SHIFTR)
VR6 = VR6 + (VR2 >> SHIFTR)
}
//
// X and Y array element 1
//
VR3 = Re(X)*Re(Y) + Im(X)*Im(Y)
VR2 = Re(X)*Im(Y) - Re(Y)*Im(X)
//
// Cycle 3:
//
// Perform accumulate
//
if(RND == 1)
{
VR5 = VR5 + round(VR1 >> SHIFTR)
VR4 = VR4 + round(VR0 >> SHIFTR)
}
else
{
VR5 = VR5 + (VR1 >> SHIFTR)
VR4 = VR4 + (VR0 >> SHIFTR)
}
//
// X and Y array element 2
//
VR1 = Re(X)*Re(Y) + Im(X)*Im(Y)
VR0 = Re(X)*Im(Y) - Re(Y)*Im(X)
etc...

```

Restrictions

VR0, VR1, VR2, and VR3 will be used as temporary storage by this instruction.

Flags

The VSTATUS register flags are modified as follows:

- OVFR is set in the case of an overflow or underflow of the addition or subtraction operations.
- OVFI is set in the case an overflow or underflow of the imaginary part of the addition or subtraction operations.

Pipeline

The VCCMAC takes $2p + N$ cycles where N is the number of times the instruction is repeated. This instruction has the following pipeline restrictions:

```

<instruction1>          ; No restriction
<instruction2>          ; Cannot be a 2p instruction that writes
                        ; to VR0, VR1...VR7 registers
RPT #(N-1)              ; Execute N times, where N is even
|| VCMAC VR7, VR6, VR5, VR4, *XAR6++, *XAR7++
<instruction3>          ; No restrictions.
                        ; Can read VR0, VR1... VR8

```

VCCMPY VR3, VR2, VR1, VR0 *Complex Conjugate Multiply*
Operands

Both inputs are complex numbers with a 16-bit real and 16-bit imaginary part. The result is a complex number with a 32-bit real and a 32-bit imaginary part. The result is stored in VR2 and VR3 as shown below:

Input Register	Value
VR0	First Complex Operand
VR1	Second Complex Operand
VR2	Imaginary part of the Result
VR3	Real part of the Result

The result is a complex number with a 16-bit real and a 16-bit imaginary part. The result is stored in VR5 as shown below:

Opcode

LSW: 1110 0101 0000 1110

Description

Complex Conjugate 16 x 16 = 32-bit multiply operation.

If the VSTATUS[CPACK] bit is set, the low word of the input is treated as the real part while the upper word is treated as imaginary. If the VSTATUS[SAT] bit is set, then the result will be saturated in the event of a 32-bit overflow or underflow. The following operation is carried out:

```

if(VSTATUS[CPACK] == 0){
    VR3 = VR0H * VR1H + VR0L * VR1L; // Re(Z) = Re(X)*Re(Y) + Im(X)*Im(Y)
    VR2 = VR0H * VR1L - VR0L * VR1H; // Im(Z) = Re(X)*Im(Y) - Im(X)*Re(Y)
}else{
    VR3 = VR0L * VR1L + VR0H * VR1H; // Re(Z) = Re(X)*Re(Y) + Im(X)*Im(Y)
    VR2 = VR0L * VR1H - VR0H * VR1L; // Im(Z) = Re(X)*Im(Y) - Im(X)*Re(Y)
}

```

Flags

This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if the VR3 computation (real part) overflows or underflows.
- OVFI is set if the VR2 computation (imaginary part) overflows or underflows.

Pipeline

This is a 2p-cycle instruction. The instruction following this one should not use VR3 or VR2.

```

VCLRCPACK                                ; cpack = 0 real part in high word

- OVFI is set if the VR2 computation (imaginary part) overflows or underflows.

Pipeline

This is a 2p/1-cycle instruction. The multiply operation takes 2p cycles and the VMOV operation completes in a single cycle. The instruction following this one should not use VR3 or VR2.

Example

```
VCLRCPACK                ; cpack = 0 real part in high word
VMOV32    VR0, *XAR4++ ; load 1st complex input      | jb + a
VMOV32    VR1, *XAR4++ ; load second complex input   | jd + c
VCCMPY    VR3, VR2, VR1, VR0 ; complex conjugate multiply|
|VMOV32    VR0, *XAR4++ ; (jb + a)*(jd + c)=(ac+bd)+j(bc-ad)
                        ; load 1st complex input      | a + jb
NOP                ; for next VCCMPY instr           |
VMOV32     *XAR5++, VR3 ; store real part first
VSETCPACK                ; cpack = 1 imag part in low word
VMOV32    VR1, *XAR4++ ; load second complex input   | c + jd
VCCMPY    VR3, VR2, VR1, VR0 ; complex conjugate multiply|
|VMOV32     *XAR5++, VR2 ; (a + jb)*(c + jd)=(ac+bd)+j(bc-ad)
                        ; store imag part of first    |
NOP                ; VCCMPY instruction              |
VMOV32     *XAR5++, VR3 ; store real part first
VMOV32     *XAR5++, VR2 ; store imag part next
VCLRCPACK
```

VCDADD16 VR5, VR4, VR3, VR2 Complex 16 + 32 = 16 Addition
Operands

Before the operation, the inputs should be loaded into registers as shown below. The first operand is a complex number with a 16-bit real and 16-bit imaginary part. The second operand has a 32-bit real and a 32-bit imaginary part.

Input Register	Value
VR4H	16-bit integer: if (VSTATUS[CPACK]==0) Re(X) else Im(X)
VR4L	16-bit integer: if (VSTATUS[CPACK]==0) Im(X) else Re(X)
VR3	32-bit integer representing the real part of the 2nd input: Re(Y)
VR2	32-bit integer representing the imaginary part of the 2nd input: Im(Y)

The result is a complex number with a 16-bit real and a 16-bit imaginary part. The result is stored in VR5 as shown below:

Output Register	Value
VR5H	16-bit integer: if (VSTATUS[CPACK]==0){ Re(Z) = (Re(X) << SHIFTL) + (Re(Y) >> SHIFTR) } else { Im(Z) = (Im(X) << SHIFTL) + (Im(Y) >> SHIFTR) }
VR5L	16-bit integer: if (VSTATUS[CPACK]==0){ Im(Z) = (Im(X) << SHIFTL) + (Im(Y) >> SHIFTR) } else { Re(Z) = (Re(X) << SHIFTL) + (Re(Y) >> SHIFTR) }

Opcode

LSW: 1110 0101 0000 0100

Description

Complex 16 + 32 = 16-bit operation. This operation is useful for algorithms similar to a complex FFT. The first operand is a complex number with a 16-bit real and 16-bit imaginary part. The second operand has a 32-bit real and a 32-bit imaginary part.

Before the addition, the first input is sign extended to 32-bits and shifted left by VSTATUS[VSHIFTL] bits. The result of the addition is left shifted by VSTATUS[VSHIFTR] before it is stored in VR5H and VR5L. If VSTATUS[RND] is set, then bits shifted out to the right are rounded, otherwise these bits are truncated. The rounding operation is described in [Section 2.3.2](#). If the VSTATUS[SAT] bit is set, then the result will be saturated in the event of a 16-bit overflow or underflow.

```
// RND    is VSTATUS[RND]
// SAT    is VSTATUS[SAT]
// SHIFTR is VSTATUS[SHIFTR]
// SHIFTL is VSTATUS[SHIFTL]
//
// VSTATUS[CPACK] = 0
// VR4H = Re(X)    16-bit
// VR4L = Im(X)    16-bit
// VR3  = Re(Y)    32-bit
// VR2  = Im(Y)    32-bit
```

```
//
// Calculate Z = X + Y
//

temp1 = sign_extend(VR4H);      // 32-bit extended Re(X)
temp2 = sign_extend(VR4L);      // 32-bit extended Im(X)

temp1 = (temp1 << SHIFTL) + VR3; // Re(Z) intermediate
temp2 = (temp2 << SHIFTL) + VR2; // Im(Z) intermediate

if (RND == 1)
{
    temp1 = round(temp1 >> SHIFTR);
    temp2 = round(temp2 >> SHIFTR);
}
else
{
    temp1 = truncate(temp1 >> SHIFTR);
    temp2 = truncate(temp2 >> SHIFTR);
}
if (SAT == 1)
{
    VR5H = sat16(temp1);
    VR5L = sat16(temp2);
}
else
{
    VR5H = temp1[15:0];
    VR5L = temp2[15:0];
}
```

Flags

This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if the real-part computation (VR5H) overflows or underflows.
- OVFI is set if the imaginary-part computation (VR5L) overflows or underflows.

Pipeline

This is a single-cycle instruction.

Example

```
;
;Example: Z = X + Y
;
; X = 4 + 3j    (16-bit real + 16-bit imaginary)
; Y = 13 + 12j  (32-bit real + 32-bit imaginary)
;
; Real:
;   temp1 = 0x00000004 + 0x0000000D = 0x00000011
;   VR5H = temp1[15:0] = 0x0011 = 17
; Imaginary:
;   temp2 = 0x00000003 + 0x0000000C = 0x0000000F
;   VR5L = temp2[15:0] = 0x000F = 15
;
VSATOFF                    ; VSTATUS[SAT] = 0
VRNDOFF                    ; VSTATUS[RND] = 0
VSETSHR    #0              ; VSTATUS[SHIFTR] = 0
VSETSHL    #0              ; VSTATUS[SHIFTL] = 0
VCLEARALL                    ; VR0, VR1...VR8 == 0
VMOVXI     VR3, #13          ; VR3 = Re(Y) = 13
VMOVXI     VR2, #12          ; VR2 = Im(Y) = 12
VMOVXI     VR4, #3
VMOVIX     VR4, #4           ; VR4 = X = 0x00040003 = 4 + 3j
VCDADD16   VR5, VR4, VR3, VR2 ; VR5 = Z = 0x0011000F = 17 + 15j
```

The next example illustrates the operation with a right shift value defined.

```
;
; Example: Z = X + Y with Right Shift
```

```

;
; X = 4 + 3j      (16-bit real + 16-bit imaginary)
; Y = 13 + 12j   (32-bit real + 32-bit imaginary)
;
; Real:
;   temp1 = (0x00000004 + 0x0000000D ) >> 1
;   temp1 = (0x00000011) >> 1 = 0x00000008.8
;   VR5H = temp1[15:0] = 0x0008 = 8
; Imaginary:
;   temp2 = (0x00000003 + 0x0000000C ) >> 1
;   temp2 = (0x0000000F) >> 1 = 0x00000007.8
;   VR5L = temp2[15:0] = 0x0007 = 7
;
; VSATOFF          ; VSTATUS[SAT] = 0
; VRNDOFF          ; VSTATUS[RND] = 0
; VSETSHR   #1     ; VSTATUS[SHIFTR] = 1
; VSETSHL   #0     ; VSTATUS[SHIFTL] = 0
; VCLEARALL          ; VR0, VR1...VR8 == 0
; VMOVXI   VR3, #13 ; VR3 = Re(Y) = 13
; VMOVXI   VR2, #12 ; VR2 = Im(Y) = 12
; VMOVXI   VR4, #3
; VMOVIX   VR4, #4   ; VR4 = X = 0x00040003 = 4 + 3j
; VCDADD16 VR5, VR4, VR3, VR2 ; VR5 = Z = 0x00080007 = 8 + 7j

```

The next example illustrates the operation with a right shift value defined as well as rounding.

```

;
; Example: Z = X + Y with Right Shift and Rounding
;
; X = 4 + 3j      (16-bit real + 16-bit imaginary)
; Y = 13 + 12j   (32-bit real + 32-bit imaginary)
;
; Real:
;   temp1 = round((0x00000004 + 0x0000000D ) >> 1)
;   temp1 = round(0x00000011 >> 1)
;   temp1 = round(0x00000008.8) = 0x00000009
;   VR5H = temp1[15:0] = 0x0011 = 8
; Imaginary:
;   temp2 = round(0x00000003 + 0x0000000C ) >> 1)
;   temp2 = round(0x0000000F >> 1)
;   temp2 = round(0x00000007.8) = 0x00000008
;   VR5L = temp2[15:0] = 0x0008 = 8
;
; VSATOFF          ; VSTATUS[SAT] = 0
; VRNDON          ; VSTATUS[RND] = 1
; VSETSHR   #1     ; VSTATUS[SHIFTR] = 1
; VSETSHL   #0     ; VSTATUS[SHIFTL] = 0
; VCLEARALL          ; VR0, VR1...VR8 == 0
; VMOVXI   VR3, #13 ; VR3 = Re(Y) = 13
; VMOVXI   VR2, #12 ; VR2 = Im(Y) = 12
; VMOVXI   VR4, #3
; VMOVIX   VR4, #4   ; VR4 = X = 0x00040003 = 4 + 3j
; VCDADD16 VR5, VR4, VR3, VR2 ; VR5 = Z = 0x00090008 = 9 + 8j

```

The next example illustrates the operation with both a right and left shift value defined along with rounding.

```

;
; Example: Z = X + Y with Right Shift, Left Shift and Rounding
;
; X = -4 + 3j     (16-bit real + 16-bit imaginary)
; Y = 13 - 9j     (32-bit real + 32-bit imaginary)
;
; Real:
;   temp1 = 0xFFFFFFF0 << 2 + 0x0000000D
;   temp1 = 0xFFFFFFF0 + 0x0000000D = 0xFFFFFFF0
;   temp1 = 0xFFFFFFF0 >> 1 = 0xFFFFFFF0.8

```

```

;   temp1 = round(0xFFFFFFFFE.8) = 0xFFFFFFFF
;   VR5H   = temp1[15:0] 0xFFFF = -1;
; Imaginary:
;   temp2 = 0x00000003 << 2 + 0xFFFFFFFF7
;   temp2 = 0x0000000C      + 0xFFFFFFFF7 = 0x00000003
;   temp2 = 0x00000003 >> 1 = 0x00000001.8
;   temp1 = round(0x000000001.8 = 0x000000002
;   VR5L   = temp2[15:0] 0x0002 = 2
;

VCDADD16 VR5, VR4, VR3, VR2 || VMOV32 VRa, mem32 *Complex Double Add with Parallel Load*
Operands

Before the operation, the inputs should be loaded into registers as shown below. The first operand is a complex number with a 16-bit real and 16-bit imaginary part. The second operand has a 32-bit real and a 32-bit imaginary part.

Input Register	Value
VR4H	16-bit integer: if (VSTATUS[CPACK]==0) Re(X) else Im(X)
VR4L	16-bit integer: if (VSTATUS[CPACK]==0) Im(X) else Re(X)
VR3	32-bit integer representing the real part of the 2nd input: Re(Y)
VR2	32-bit integer representing the imaginary part of the 2nd input: Im(Y)
mem32	pointer to a 32-bit memory location.

The result is a complex number with a 16-bit real and a 16-bit imaginary part. The result is stored in VR5 as shown below:

Output Register	Value
VR5H	16-bit integer: if (VSTATUS[CPACK]==0){ Re(Z) = (Re(X) << SHIFTL) + (Re(Y)) >> SHIFTR } else { Im(Z) = (Im(X) << SHIFTL) + (Im(Y)) >> SHIFTR }
VR5L	16-bit integer: if (VSTATUS[CPACK]==0){ Im(Z) = (Im(X) << SHIFTL) + (Im(Y)) >> SHIFTR } else { Re(Z) = (Re(X) << SHIFTL) + (Re(Y)) >> SHIFTR }
VRa	Contents of the memory pointed to by [mem32]. VRa can not be VR5 or VR8.

Opcode

MSW: 0000 aaaa mem32
```

Description

Complex 16 + 32 = 16-bit operation with parallel register load. This operation is useful for algorithms similar to a complex FFT.

The first operand is a complex number with a 16-bit real and 16-bit imaginary part. The second operand has a 32-bit real and a 32-bit imaginary part.

Before the addition, the first input is sign extended to 32-bits and shifted left by VSTATUS[VSHIFTL] bits. The result of the addition is left shifted by VSTATUS[VSHIFTR] before it is stored in VR5H and VR5L. If VSTATUS[RND] is set, then bits shifted out to the right are rounded, otherwise these bits are truncated. The rounding operation is described in [Section 2.3.2](#). If the VSTATUS[SAT] bit is set, then the result will be saturated in the event of a 16-bit overflow or underflow.

```
// RND is VSTATUS[RND]
```

```
// SAT is VSTATUS[SAT]
// SHIFTR is VSTATUS[SHIFTR]
// SHIFTL is VSTATUS[SHIFTL]
//
// VSTATUS[CPACK] = 0
// VR4H = Re(X) 16-bit
// VR4L = Im(X) 16-bit
// VR3 = Re(Y) 32-bit
// VR2 = Im(Y) 32-bit

temp1 = sign_extend(VR4H); // 32-bit extended Re(X)
temp2 = sign_extend(VR4L); // 32-bit extended Im(X)

temp1 = (temp1 << SHIFTL) + VR3; // Re(Z) intermediate
temp2 = (temp2 << SHIFTL) + VR2; // Im(Z) intermediate

if (RND == 1)
{
    temp1 = round(temp1 >> SHIFTR);
    temp2 = round(temp2 >> SHIFTR);
}
else
{
    temp1 = truncate(temp1 >> SHIFTR);
    temp2 = truncate(temp2 >> SHIFTR);
}

    VR5L = sat16(temp2);
}
else
{
    VR5H = temp1[15:0];
    VR5L = temp2[15:0];
}
```

Flags

This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if the real-part (VR6H) computation overflows or underflows.
- OVFI is set if the imaginary-part (VR6L) computation overflows or underflows.

Pipeline

This is a single-cycle instruction.

Example

```
;
; Example: Z = X - Y
;
; X =  4 +  6j   (16-bit real + 16-bit imaginary)
; Y = 13 + 22j   (32-bit real + 32-bit imaginary)
;
; Z = (4 - 13) + (6 - 22)j = -9 - 16j
;
VSATOFF                ; VSTATUS[SAT] = 0
VRNDOFF                ; VSTATUS[RND] = 0
VSETSHR   #0           ; VSTATUS[SHIFTR] = 0
VSETSHL   #0           ; VSTATUS[SHIFTL] = 0
VCLEARALL                ; VR0, VR1...VR8 = 0
VMOVXI    VR3, #13       ; VR3 = Re(Y) = 13 = 0x0000000D
VMOVXI    VR2, #22       ; VR2 = Im(Y) = 22j = 0x00000016
VMOVXI    VR4, #6
VMOVIX    VR4, #4        ; VR4 = X = 0x00040006 =  4 +  6j
VCDSUB16  VR6, VR4, VR3, VR2 ; VR5 = Z = 0xFFFF7FFF0 = -9 + -16j
```

The next example illustrates the operation with a right shift value defined.

```
;
; Example: Z = X - Y with Right Shift
;
; Y =  4 +  6j   (16-bit real + 16-bit imaginary)
; X = 13 + 22j   (32-bit real + 32-bit imaginary)
;
; Real:
;   temp1 = (0x00000004 - 0x0000000D) >> 1
;   temp1 = (0xFFFFFFF7) >> 1
```

```

;   temp1 = 0xFFFFFFFFB
;   VR5H = temp1[15:0] = 0xFFFB = -5
; Imaginary:
;   temp2 = (0x00000006 - 0x00000016) >> 1
;   temp2 = (0xFFFFFFFF0) >> 1
;   temp2 = 0xFFFFFFFF8
;   VR5L = temp2[15:0] = 0xFFF8 = -8
;
VSATOFF                    ; VSTATUS[SAT] = 0
VRNDOFF                    ; VSTATUS[RND] = 0
VSETSHR   #1               ; VSTATUS[SHIFTR] = 1
VSETSHL   #0               ; VSTATUS[SHIFTL] = 0
VCLEARALL                    ; VR0, VR1...VR8 == 0
VMOVXI    VR3, #13          ; VR3 = Re(Y) = 13 = 0x0000000D
VMOVXI    VR2, #22          ; VR2 = Im(Y) = 22j = 0x00000016
VMOVXI    VR4, #6
VMOVIX    VR4, #4           ; VR4 = X = 0x00040006 = 4 + 6j
VCDSUB16  VR6, VR4, VR3, VR2 ; VR5 = Z = 0xFFFBFFF8 = -5 + -8j

```

The next example illustrates rounding with a right shift value defined.

```

;
; Example: Z = X-Y with Rounding and Right Shift
;
; X =   4 + 6j              (16-bit real + 16-bit imaginary)
; Y = -13 + 22j             (32-bit real + 32-bit imaginary)
;
; Real:
;   temp1 = round((0x00000004 - 0xFFFFFFFF3) >> 1)
;   temp1 = round(0x00000011) >> 1)
;   temp1 = round(0x00000008.8) = 0x00000009
;   VR5H = temp1[15:0] = 0x0009 = 9
; Imaginary:
;   temp2 = round((0x00000006 - 0x00000016) >> 1)
;   temp2 = round(0xFFFFFFFF0) >> 1)
;   temp2 = round(0xFFFFFFFF8.0) = 0xFFFFFFFF8
;   VR5L = temp2[15:0] = 0xFFF8 = -8
;
VSATOFF                    ; VSTATUS[SAT] = 0
VRNDON                     ; VSTATUS[RND] = 1
VSETSHR   #1               ; VSTATUS[SHIFTR] = 1
VSETSHL   #0               ; VSTATUS[SHIFTL] = 0
VCLEARALL                    ; VR0, VR1...VR8 == 0
VMOVXI    VR3, #-13        ; VR3 = Re(Y)
VMOVIX    VR3, #0xFFFF    ; sign extend VR3 = -13 = 0xFFFFFFFF3
VMOVXI    VR2, #22          ; VR2 = Im(Y) = 22j = 0x00000016
VMOVXI    VR4, #6
VMOVIX    VR4, #4           ; VR4 = X = 0x00040006 = 4 + 6j
VCDSUB16  VR6, VR4, VR3, VR2 ; VR5 = Z = 0x0009FFF8 = 9 + -8j

```

The next example illustrates rounding with both a left and a right shift value defined.

```

;
; Example: Z = X-Y with Rounding and both Left and Right Shift
;
; X =   4 + 6j              (16-bit real + 16-bit imaginary)
; Y = -13 + 22j             (32-bit real + 32-bit imaginary)
;
; Real:
;   temp1 = round((0x00000004 << 2 - 0xFFFFFFFF3) >> 1)
;   temp1 = round((0x00000010 - 0xFFFFFFFF3) >> 1)
;   temp1 = round( 0x0000001D >> 1)
;   temp1 = round( 0x0000000E.8) = 0x0000000F
;   VR5H = temp1[15:0] = 0x000F = 15
; Imaginary:
;   temp2 = round((0x00000006 << 2 - 0x00000016) >> 1)

```

```

;   temp2 = round((0x00000018      - 0x00000016) >> 1)
;   temp2 = round( 0x00000002 >> 1)
;   temp1 = round( 0x00000001.0) = 0x00000001
;   VR5L  = temp2[15:0] = 0x0001 = 1
;
VSATOFF                                ; VSTATUS[SAT] = 0

VCDSUB16 VR6, VR4, VR3, VR2 || VMOV32 VRa, mem32 *Complex 16-32 = 16 Subtract with Parallel Load*

Operands

Before the operation, the inputs should be loaded into registers as shown below. The first operand is a complex number with a 16-bit real and 16-bit imaginary part. The second operand has a 32-bit real and a 32-bit imaginary part.

Input Register	Value
VR4H	16-bit integer: if (VSTATUS[CPACK]==0) Re(X) else Im(X)
VR4L	16-bit integer: if (VSTATUS[CPACK]==0) Im(X) else Re(X)
VR3	32-bit integer representing the real part of the 2nd input: Re(Y)
VR2	32-bit integer representing the imaginary part of the 2nd input: Im(Y)
mem32	pointer to a 32-bit memory location.

The result is a complex number with a 16-bit real and a 16-bit imaginary part. The result is stored in VR6 as shown below:

Output Register	Value
VR6H	16-bit integer: if (VSTATUS[CPACK]==0){ Re(Z) = (Re(X) << SHIFTL) - (Re(Y)) >> SHIFTR } else { Im(Z) = (Im(X) << SHIFTL) - (Im(Y)) >> SHIFTR } }
VR6L	16-bit integer: if (VSTATUS[CPACK]==0){ Im(Z) = (Im(X) << SHIFTL) - (Im(Y)) >> SHIFTR } else { Re(Z) = (Re(X) << SHIFTL) - (Re(Y)) >> SHIFTR } }
VRa	Contents of the memory pointed to by [mem32]. VRa cannot be VR6 or VR8.

Opcode

```
LSW: 1110 0010 1100 1010
MSW: 0000 0000 mem16
```

Description

Complex 16 - 32 = 16-bit operation with parallel load. This operation is useful for algorithms similar to a complex FFT.

The first operand is a complex number with a 16-bit real and 16-bit imaginary part. The second operand has a 32-bit real and a 32-bit imaginary part.

Before the addition, the first input is sign extended to 32-bits and shifted left by VSTATUS[VSHIFTL] bits. The result of the subtraction is left shifted by VSTATUS[VSHIFTR] before it is stored in VR5H and VR5L. If VSTATUS[RND] is set, then bits shifted out to the right are rounded, otherwise these bits are truncated. The rounding operation is described in [Section 2.3.2](#). If the VSTATUS[SAT] bit is set, then the result will be saturated in the event of a 16-bit overflow or underflow.

```
// RND    is VSTATUS[RND]
// SAT    is VSTATUS[SAT]
```

```
// SHIFTR is VSTATUS[SHIFTR]
// SHIFTL is VSTATUS[SHIFTL]
//
// VSTATUS[CPACK] = 0
// VR4H = Re(X)      16-bit
// VR4L = Im(X)      16-bit
// VR3  = Re(Y)      32-bit
// VR2  = Im(Y)      32-bit

temp1 = sign_extend(VR4H);      // 32-bit extended Re(X)
temp2 = sign_extend(VR4L);      // 32-bit extended Im(X)

if (RND == 1)
{
    temp1 = round(temp1 >> SHIFTR);
    temp2 = round(temp2 >> SHIFTR);
}
else
{
    temp1 = truncate(temp1 >> SHIFTR);
    temp2 = truncate(temp2 >> SHIFTR);
}
if (SAT == 1)
{
    VR5H = sat16(temp1);
    VR5L = sat16(temp2);
}
else
{
    VR5H = temp1[15:0];
    VR5L = temp2[15:0];
}
VRa = [mem32];
```

Flags

This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if the real-part (VR6H) computation overflows or underflows.
- OVFI is set if the imaginary-part (VR6L) computation overflows or underflows.

Pipeline

Both operations complete in a single cycle.

Example

For more information regarding the subtraction operation, please refer to [VCDSUB16 VR6, VR4, VR3, VR2](#).

```
;
; Example: Z = X-Y with Rounding and both Left and Right Shift
;
; X =   4 +   6j      (16-bit real + 16-bit imaginary)

Description

Complex 16 x 16 = 32-bit multiply operation.

If the VSTATUS[CPACK] bit is set, the low word of the input is treated as the real part while the upper word is treated as imaginary. If the VSTATUS[SAT] bit is set, the result will be saturated in the event of a 32-bit overflow or underflow.

```
// Calculate: Z = (X + jX) * (Y + jY)
//
if(VSTATUS[CPACK] == 0){
    VR3 = VR0H * VR1H - VR0L * VR1L; // Re(Z) = Re(X)*Re(Y) - Im(X)*Im(Y)
    VR2 = VR0H * VR1L + VR0L * VR1H; // Im(Z) = Re(X)*Im(Y) + Im(X)*Re(Y)
}else{
    VR3 = VR0L * VR1L - VR0H * VR1H; // Re(Z) = Re(X)*Re(Y) - Im(X)*Im(Y)
    VR2 = VR0L * VR1H + VR0H * VR1L; // Im(Z) = Re(X)*Im(Y) + Im(X)*Re(Y)
}
if(SAT == 1)
{
    sat32(VR3);
    sat32(VR2);
}
```

Flags

This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if the VR3 computation (real part) overflows or underflows.
- OVFI is set if the VR2 computation (imaginary part) overflows or underflows.

Pipeline

This is a 2p-cycle instruction. The instruction following this one should not use VR3 or VR2.

Example

```
; Example 1
; X = 4 + 6j
; Y = 12 + 9j
;
; Z = X * Y
; Re(Z) = 4*12 - 6*9 = -6
; Im(Z) = 4*9 + 6*12 = 108
;
    VSATOFF                    ; VSTATUS[SAT] = 0

VCMPY VR3, VR2, VR1, VR0 || VMOV32 mem32, VRa *Complex Multiply with Parallel Store*
Operands

Both inputs are complex numbers with a 16-bit real and 16-bit imaginary part. The result is a complex number with a 32-bit real and a 32-bit imaginary part. The result is stored in VR2 and VR3 as shown below:

Input Register	Value
VR3	Real part of the Result
VR2	Imaginary part of the Result
VR1	Second Complex Operand
VR0	First Complex Operand
VRa	Value to be stored
mem32	Pointer to 32-bit memory location

Opcode

LSW: 1110 0010 1100 1010
MSW: 0000 aaaa mem16

Description

Complex 16 x 16 = 32-bit multiply operation with parallel register load.

If the VSTATUS[CPACK] bit is set, the low word of the input is treated as the real part while the upper word is treated as imaginary. If the VSTATUS[SAT] bit is set, then the result will be saturated in the event of a 32-bit overflow or underflow.

```
// Calculate: Z = (X + jX) * (Y + jY)
//
if(VSTATUS[CPACK] == 0){
    VR3 = VR0H * VR1H - VR0L * VR1L; // Re(Z) = Re(X)*Re(Y) - Im(X)*Im(Y)
    VR2 = VR0H * VR1L + VR0L * VR1H; // Im(Z) = Re(X)*Im(Y) + Im(X)*Re(Y)
}else{
    VR3 = VR0L * VR1L - VR0H * VR1H; // Re(Z) = Re(X)*Re(Y) - Im(X)*Im(Y)
    VR2 = VR0L * VR1H + VR0H * VR1L; // Im(Z) = Re(X)*Im(Y) + Im(X)*Re(Y)
}
if(SAT == 1)
{
    sat32(VR3);
    sat32(VR2);
}
VRa = [mem32];
```

Flags

This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if the VR3 computation (real part) overflows or underflows.
- OVFI is set if the VR2 computation (imaginary part) overflows or underflows.

Pipeline

This is a 2p/1-cycle instruction. The multiply operation takes 2p cycles and the VMOV operation completes in a single cycle. The instruction following this one must not use VR2 or VR3.

Example

```
; Example 1
; X = 4 + 6j

VCSHL16 VRa << #4-bit *Complex Shift Left*

Operands

VRa	General purpose register VR0...VR8
#4-bit	4-bit unsigned immediate value

Opcode

LSW: 1110 0110 1111 0010
MSW: 0000 0000 IIII aaaa

Description

Left Shift the Real and Imaginary parts of the complex value in VRa.

```
if(VSTATUS[CPACK] == 0){
    if(VSTATUS[SAT] == 1){
        VRaL = sat(VRaL <<#4-bit Immediate) (imaginary result)
        VRaH = sat(VRaH << #4-bit Immediate) (real result)
    }else {
        VRaL = VRaL << #4-bit Immediate (imaginary result)
        VRaH = VRaH << #4-bit Immediate (real result)
    }
}
}else {
    If(VSTATUS[SAT] == 1){
        VRaL = sat(VRaL << #4-bit Immediate) (real result)
        VRaH = sat(VRaH << #4-bit Immediate) (imaginary result)
    }else {
        VRaL = VRaL << #4-bit Immediate (real result)
        VRaH = VRaH << #4-bit Immediate (imaginary result)
    }
}
```

Flags

This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if overflow is detected in the shift left operation of the real signed-16-bit result.
- OVFI is set if overflow is detected in the shift left operation of the imaginary signed-16-bit result.

Pipeline

This is a single-cycle instruction.

Example

```
VSATOFF          ; turn off saturation
VCSHL16   VR5 << #8 ; VR5L := VR5L << 8 | VR5H := VR5H << 8
```

See also

Operands

VRa	General purpose register VR0...VR8
#4-bit	4-bit unsigned immediate value

Opcode

LSW: 1110 0110 1111 0010
MSW: 0000 0000 IIII aaaa

Description

Right Shift the Real and Imaginary parts of the complex value in VRa.

```

if(VSTATUS[CPACK] == 0){
if(VSTATUS[RND] == 1){
    VRaL = rnd(VRaL >> #4-bit Immediate) (imaginary result)
    VRaH = rnd(VRaH >> #4-bit Immediate) (real result)
}else {
    VRaL = VRaL >> #4-bit Immediate (imaginary result)
    VRaH = VRaH >> #4-bit Immediate (real result)
}
}else {
    If(VSTATUS[RND] == 1){
        VRaL = rnd(VRaL >> #4-bit Immediate) (real result)
        VRaH = rnd(VRaH >> #4-bit Immediate) (imaginary result)
    }else {
        VRaL = VRaL >> #4-bit Immediate (real result)
        VRaH = VRaH >> #4-bit Immediate (imaginary result)
    }
}
}

```

Sign-Extension is automatically done for the shift right operations

Flags

This instruction does not affect any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

```

VSATOFF          ; turn off saturation
VCSHR16   VR6 << #8 ; VR6L := VR6L << 8 | VR6H := VR6H << 8

```

See also

VCSUB VR5, VR4, VR3, VR2 *Complex 32 - 32 = 32 Subtraction*
Operands

Before the operation, the inputs should be loaded into registers as shown below. Each complex number includes a 32-bit real and a 32-bit imaginary part.

Input Register	Value
VR5	32-bit integer representing the real part of the first input: Re(X)
VR4	32-bit integer representing the imaginary part of the first input: Im(X)
VR3	32-bit integer representing the real part of the 2nd input: Re(Y)
VR2	32-bit integer representing the imaginary part of the 2nd input: Im(Y)

The result is also a complex number with a 32-bit real and a 32-bit imaginary part. The result is stored in VR5 and VR4 as shown below:

Output Register	Value
VR5	32-bit integer representing the real part of the result: $\text{Re}(Z) = \text{Re}(X) - (\text{Re}(Y) \gg \text{SHIFTR})$
VR4	32-bit integer representing the imaginary part of the result: $\text{Im}(Z) = \text{Im}(X) - (\text{Im}(Y) \gg \text{SHIFTR})$

Opcode

LSW: 1110 0101 0000 0011

Description

Complex 32 - 32 = 32-bit subtraction operation.

The second input operand (stored in VR3 and VR2) is shifted right by VSTATUS[SHIFR] bits before the subtraction. If VSTATUS[RND] is set, then bits shifted out to the right are rounded, otherwise these bits are truncated. The rounding operation is described in [Section 2.3.2](#). If the VSTATUS[SAT] bit is set, then the result will be saturated in the event of an overflow or underflow.

```
// RND    is VSTATUS[RND]
// SAT    is VSTATUS[SAT]
// SHIFTR is VSTATUS[SHIFTR]
//
if (RND == 1)
{
    VR5 = VR5 - round(VR3 >> SHIFTR);
    VR4 = VR4 - round(VR2 >> SHIFTR);
}
else
{
    VR5 = VR5 - (VR3 >> SHIFTR);
    VR4 = VR4 - (VR2 >> SHIFTR);
}
if (SAT == 1)
{
    sat32(VR5);
    sat32(VR4);
}
```

Flags

This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if the VR5 computation (real part) overflows or underflows.
- OVFI is set if the VR6 computation (imaginary part) overflows or underflows.

Pipeline

This is a single-cycle instruction.

VCRC8H_1 mem16 *CRC8, High Byte*
Operands

mem16	16-bit memory location
-------	------------------------

Opcode

```
LSW: 1110 0010 1100 1100
MSW: 0000 0000    mem16
```

Description

This instruction uses CRC8 polynomial == 0x07.

Calculate the CRC8 of the most significant byte pointed to by mem16 and accumulate it with the value in the VCRC register. Store the result in VCRC.

```
if (VSTATUS[CRCMSGFLIP == 0]){
    temp[7:0] = [mem16][15:8];
}else {
    temp[7:0] = [mem16][8:15];
}
```

```
VCRC[7:0] = CRC8 (VCRC[7:0], temp[7:0])
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

Refer to the example for [VCRC8L_1 mem16](#)

See also

[VCRC8L_1 mem16](#)

VCRC8L_1 mem16 *CRC8 , Low Byte*

Operands

mem16	16-bit memory location
-------	------------------------

Opcode

LSW: 1110 0010 1100 1011
MSW: 0000 0000 mem16

Description

This instruction uses CRC8 polynomial == 0x07.

Calculate the CRC8 of the least significant byte pointed to by mem16 and accumulate it with the value in the VCRC register. Store the result in VCRC.

```
if (VSTATUS[CRCMSGFLIP] == 0){
    temp[7:0] = [mem16][7:0];
}else{
    temp[7:0] = [mem16][0:7];
}
VCRC[7:0] = CRC8 (VCRC[7:0], temp[7:0])
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

```

VCRC16P1H_1 mem16 *CRC16, Polynomial 1, High Byte*
Operands

mem16	16-bit memory location
-------	------------------------

Opcode

```
LSW: 1110 0010 1100 1111
MSW: 0000 0000 mem16
```

Description

This instruction uses CRC16 polynomial 1 == 0x8005.

Calculate the CRC16 of the most significant byte pointed to by mem16 and accumulate it with the value in the VCRC register. Store the result in VCRC.

```
if (VSTATUS[CRCMSGFLIP] == 0){
    temp[7:0] = [mem16][15:8];
}else {
    temp[7:0] = [mem16][8:15];
}
```

```
VCRC[15:0] = CRC16(VCRC[15:0], temp[7:0])
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

Refer to the example for [VCRC16P1L_1 mem16](#).

VCRC16P1L_1 mem16 *CRC16, Polynomial 1, Low Byte*
Operands

mem16	16-bit memory location
-------	------------------------

Opcode

```
LSW: 1110 0010 1100 1110
MSW: 0000 0000 mem16
```

Description

This instruction uses CRC16 polynomial 1 == 0x8005.

Calculate the CRC16 of the least significant byte pointed to by mem16 and accumulate it with the value in the VCRC register. Store the result in VCRC.

```
if (VSTATUS[CRMSGFLIP] == 0){
    temp[7:0] = [mem16][7:0];
}else {
    temp[7:0] = [mem16][0:7];
}

VCRC[15:0] = CRC16 (VCRC[15:0], temp[7:0])
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

```
typedef struct {
    uint32_t *CRCResult;    // Address where result should be stored
    uint16_t *CRCDData;     // Start of data
    uint16_t CRCLen;        // Length of data in bytes
}CRC_CALC;

CRC_CALC mycrc;

2.5.6 Deinterleaver Instructions

The instructions are listed alphabetically, preceded by a summary.

Table 2-15. Deinterleaver Instructions

Title	Page
VCLR DIVE — Clear DIVE bit in the VSTATUS Register.....	286
VDEC VRaL — 16-bit Decrement	287
VDEC VRaL VMOV32 VRb, mem32 — 16-bit Decrement with Parallel Load.....	288
VINC VRaL — 16-bit Increment	289
VINC VRaL VMOV32 VRb, mem32 — 16-bit Increment with Parallel Load	290
VMOD32 VRaH, VRb, VRcH — Modulo Operation.....	291
VMOD32 VRaH, VRb, VRcH VMOV32 VRd, VRe — Modulo Operation with Parallel Move	292
VMOD32 VRaH, VRb, VRcL — Modulo Operation	293
VMOD32 VRaH, VRb, VRcL VMOV32 VRd, VRe — Modulo Operation with Parallel Move	294
VMOV16 VRaL, VRbH — 16-bit Register Move.....	295
VMOV16 VRaH, VRbL — 16-Bit Register Move	296
VMOV16 VRaH, VRbH — 16-Bit Register Move	297
VMOV16 VRaL, VRbL — 16-Bit Register Move.....	298
VMPYADD VRa, VRaL, VRaH, VRbH — Multiply Add 16-Bit.....	299
VMPYADD VRa, VRaL, VRaH, VRbL — Multiply Add 16-bit	300

VCLRDIVE	<i>Clear DIVE bit in the VSTATUS Register</i>
Operands	none
Opcode	LSW: 1110 0101 0010 0000
Description	Clear the DIVE (Divide by zero error) bit in the VSTATUS register.
Flags	This instruction clears the DIVE bit in the VSTATUS register
Pipeline	This is a single-cycle operation
Example	
See also	

VDEC VRaL **16-bit Decrement**

Operands

VRaL	Low word of a general purpose register: VR0L, VR1L....VR7L. Cannot be VR8L
------	--

Opcode

```
LSW: 1110 0110 1111 0010
MSW: 0000 1011 0000 1aaa
```

Description
16-bit Increment

$$\text{VRaL} = \text{VRaL} - 1$$
Flags

This instruction does not affect any flags in the VSTATUS register

Pipeline

This is a single-cycle instruction

Example

```
VDEC VR0L    ; VR0L = VR0L - 1
```

VDEC VRaL || VMOV32 VRb, mem32 16-bit Decrement with Parallel Load

Operands

VRaL	Low word of a general purpose register: VR0L, VR1L....VR7L. Cannot be VR8L
VRb	General purpose register: VR0, VR1....VR7. Cannot be VR8
mem32	Pointer to 32-bit memory location

Opcode

LSW: 1110 0010 1000 0001
MSW: 01bb baaa mem32

Description

16-bit Decrement with Parallel Load

$VRaL = VRaL - 1$
 $VRb = [mem32]$

Flags

This instruction does not affect any flags in the VSTATUS register

Pipeline

This is a single-cycle instruction

Example

VDEC VR0L || VMOV32 VR1, *+XAR3[4]

VINC VRaL 16-bit Increment

Operands

VRaL	Low word of a general purpose register: VR0L, VR1L....VR7L. Cannot be VR8L
------	--

Opcode

```
LSW: 1110 0110 1111 0010
MSW: 0000 1011 0000 0aaa
```

Description
16-bit Increment

$$\text{VRaL} = \text{VRaL} + 1$$
Flags

This instruction does not affect any flags in the VSTATUS register

Pipeline

This is a single-cycle instruction

Example

```
VINC VR0L    ; VR0L = VR0L + 1
```

VINC VRaL || VMOV32 VRb, mem32 16-bit Increment with Parallel Load

Operands

VRaL	Low word of a general purpose register: VR0L, VR1L....VR7L. Cannot be VR8L
VRb	General purpose register: VR0, VR1....VR7. Cannot be VR8
mem32	Pointer to 32-bit memory location

Opcode

LSW: 1110 0010 1000 0001
MSW: 00bb baaa mem32

Description

16-bit Increment with parallel load

VRaL = VRaL +1
VRb = [mem32]

Flags

This instruction does not affect any flags in the VSTATUS register

Pipeline

This is a single-cycle instruction

Example

VINC VR0L || VMOV32 VR1, *+XAR3[4]

VMOD32 VRaH, VRb, VRcH *Modulo Operation*

Operands

VRaH	High word of a general purpose register: VR0H, VR1H....VR7H. Cannot be VR8H
VRb	General purpose register: VR0, VR1....VR7. Cannot be VR8
VRcH	High word of a general purpose register: VR0H, VR1H....VR7H. Cannot be VR8H

Opcode

```
LSW: 1110 0110 1000 0000
MSW: 0010 100a aabb bccc
```

Description

Modulo operation: 32-bit signed %16 bit unsigned

```
if (VRcH == 0x0){
    VSTATUS[DIVE] = 1
}else{
    VRaH = VRb % VRcH
}
```

Flags

This instruction modifies the following bits in the VSTATUS register:

- DIVE is set if VRcH is 0 i.e. a divide by zero error.

Pipeline

This is a 9p cycle instruction. No VMOD32 related instruction can be present in the delay slot of this instruction.

Example

```
VMOD32 VR5H, VR3, VR4H      ; VR5H = VR3%VR4H = j
                             ; compute j = (b * J - v * i) % n;
NOP                          ; D1
MOV *+XAR1[AR0], AL          ; D2    Save previous Y(i+j*m)
NOP                          ; D3
NOP                          ; D4
MOV AL, *XAR4++              ; D5    AL = X(I)    load X(I)
NOP                          ; D6
NOP                          ; D7
NOP                          ; D8
VMPYADD VR5, VR5L, VR5H, VR4H
                             ; VR5 = VR5L + VR5H*VR4H
                             ;      = i + j*m    compute i + j*m
```

Opcode

```
LSW: 1110 0110 1111 0011
MSW: 1eee dddc ccbb baaa
```

Description

Modulo operation: 32-bit signed %16 bit unsigned

```
if(VRcL == 0x0){
    VSTATUS[DIVE] = 1
}else{
    VRaH = VRb % VRcH
}
VRd = VRe
```

Flags

This instruction modifies the following bits in the VSTATUS register:

- DIVE is set if VRcH is 0, that is, a divide by zero error.

Pipeline

This is a 9p/1 cycle instruction. The VMOD32 instruction takes 9p cycles while the VMOV32 operation completes in a single cycle. No VMOD32 related instruction can be present in the delay slot of this instruction.

Example

```
VMOD32 VR5H, VR3, VR4H ; VR5H = VR3%VR4H = j; VR0 = {J,I}
|| VMOV32 VR0, VR6      ; compute j = (b * J - v * i) % n;

 [VMOV16 VRaH, VRbH](#)

VMPYADD VRa, VRaL, VRaH, VRbH *Multiply Add 16-Bit*

Operands

VRbH	High word of a general purpose register: VR0H, VR1H....VR7H. Cannot be VR8H
VRaH	Low word of a general purpose register: VR0H, VR1H....VR7H. Cannot be VR8H
VRaL	Low word of a general purpose register: VR0L, VR1L....VR7L. Cannot be VR8L
VRa	General purpose register: VR0, VR1....VR7. Cannot be VR8

Opcode

```
LSW: 1110 0110 1111 0010
MSW: 0000 1100 00bb baaa
```

Description

Performs $p + q * r$, where p,q, and r are 16-bit values

```
If(VSTATUS[SAT] == 1){
    If(VSTATUS[RND] == 1){
        VRa = rnd(sat(VRaL + VRaH * VRbH)>>VSTATUS[SHIFTR]);
    }else {
        VRa = sat(VRaL + VRaH * VRbH)>>VSTATUS[SHIFTR];
    }
}else { //VSTATUS[SAT] = 0
    If(VSTATUS[RND] == 1){
        VRa = rnd((VRaL + VRaH * VRbH)>>VSTATUS[SHIFTR]);
    }else {
        VRa = (VRaL + VRaH * VRbH)>>VSTATUS[SHIFTR];
    }
}
```

It should be noted that:

- VRaH*VRbH is represented as 32-bit temp value
- VRaL should be sign extended to 32-bit before performing add
- The add operation is a 32-bit operation

Flags

This instruction modifies the following bits in the VSTATUS register:

- •OVFR is set if signed overflow if 32-bit signed overflow is detected in the add operation.

Pipeline

This is a 2p cycle operation

Example

```
VMPYADD VR5, VR5L, VR5H, VR4H ; VR5 = VR5L + VR5H*VR4H
                                ;      = i + j*m compute i + j*m
NOP                             ; D1
```

Opcode

```
LSW: 1110 0110 1111 0010
MSW: 0000 1100 01bb baaa
```

Description

Performs $p + q \cdot r$, where p,q, and r are 16-bit values

```
If(VSTATUS[SAT] == 1){
    If(VSTATUS[RND] == 1){
        VRa = rnd(sat(VRaL + VRaH * VRbL)>>VSTATUS[SHIFTR]);
    }else {
        VRa = sat(VRaL + VRaH * VRbL)>>VSTATUS[SHIFTR];
    }
}else { //VSTATUS[SAT] = 0
    If(VSTATUS[RND] == 1){
        VRa = rnd((VRaL + VRaH * VRbL)>>VSTATUS[SHIFTR]);
    }else {
        VRa = (VRaL + VRaH * VRbL)>>VSTATUS[SHIFTR];
    }
}
```

It should be noted that:

- VRaH* VRbL is represented as 32-bit temp value
- VRaL should be sign extended to 32-bit before performing add
- The add operation is a 32-bit operation

Flags

This instruction modifies the following bits in the VSTATUS register:

- •OVFR is set if signed overflow if 32-bit signed overflow is detected in the add operation.

Pipeline

This is a 2p cycle operation

Example

```
VMPYADD VR5, VR5L, VR5H, VR4L ; VR5 = VR5L + VR5H*VR4L
                                ;      = i + j*m compute i + j*m
NOP                             ; D1
```

VCFFT4 VR4, VR2, VR1, VR0, #1-bit —Complex FFT calculation instruction	311
VCFFT4 VR4, VR2, VR1, VR0, #1-bit VMOV32 VR7, mem32 —Complex FFT calculation instruction with Parallel Load	313
VCFFT5 VR5, VR4, VR3, VR2, VR1, VR0, #1-bit VMOV32 mem32, VR1 —Complex FFT calculation instruction with Parallel Load	315
VCFFT6 VR3, VR2, VR1, VR0, #1-bit VMOV32 mem32, VR1 —Complex FFT calculation instruction with Parallel Load	317
VCFFT7 VR1, VR0, #1-bit VMOV32 VR2, mem32 —Complex FFT calculation instruction with Parallel Load	318
VCFFT8 VR3, VR2, #1-bit —Complex FFT calculation instruction	319
VCFFT8 VR3, VR2, #1-bit VMOV32 mem32, VR4 —Complex FFT calculation instruction with Parallel Store	320
VCFFT9 VR5, VR4, VR3, VR2, VR1, VR0 #1-bit —Complex FFT calculation instruction	321
VCFFT9 VR5, VR4, VR3, VR2, VR1, VR0 #1-bit VMOVE32 mem32, VR5 —Complex FFT calculation instruction with Parallel Store	322
VCFFT10 VR7, VR6, VR3, VR2, VR1, VR0 #1-bit —Complex FFT calculation instruction	324
VCFFT10 VR7, VR6, VR3, VR2, VR1, VR0 #1-bit VMOV32 VR0, mem32 —Complex FFT calculation instruction with Parallel Load	328

VCFFT1 VR2, VR5, VR4 *Complex FFT calculation instruction*

Operands This operation assumes the following complex packing order for complex operands:
 VRa[31:16] = Imaginary Part
 VRa[15:0] = Real Part
 It ignores the VSTATUS[CPACK] bit.

VR4	First Complex Input
VR5	Second Complex Input
VR2	Complex Output

Opcode LSW: 1110 0101 0010 1011

Description This operation is used in the butterfly operation of the FFT:

```

If(VSTATUS[SAT] == 1){
  If(VSTATUS[RND] == 1){
    VR2H = rnd(sat(VR5H*VR4L - VR5L*VR4H)>>VSTATUS[SHIFTR])
    VR2L = rnd(sat(VR5L*VR4L + VR5H*VR4H)>>VSTATUS[SHIFTR])
  }else {
    VR2H = sat(VR5H*VR4L - VR5L*VR4H)>>VSTATUS[SHIFTR]
    VR2L = sat(VR5L*VR4L + VR5H*VR4H)>>VSTATUS[SHIFTR]
  }
}else { //VSTATUS[SAT] = 0
  If(VSTATUS[RND] == 1){
    VR2H = rnd((VR5H*VR4L - VR5L*VR4H)>>VSTATUS[SHIFTR])
    VR2L = rnd((VR5L*VR4L + VR5H*VR4H)>>VSTATUS[SHIFTR])
  }else {
    VR2H = (VR5H*VR4L - VR5L*VR4H)>>VSTATUS[SHIFTR]
    VR2L = (VR5L*VR4L + VR5H*VR4H)>>VSTATUS[SHIFTR]
  }
}

```

Sign-Extension is automatically done for the shift right operations

Flags This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if signed overflow is detected for add/sub calculation in which destination is VRxL
- OVFI is set if signed overflow is detected for add/sub calculation in which destination is VRxH
- The OVFR and OVFI flags are also set if, after shift right operation, the 32-bit temporary result can't fit in 16-bit destination

Pipeline This is a two cycle instruction

Example See the example for [VCFFT10 VR7, VR6, VR3, VR2, VR1, VR0, #1-bit](#)

VCFFT2 VR7, VR6, VR4, VR2, VR1, VR0, #1-bit *Complex FFT calculation instruction*

Operands This operation assumes the following complex packing order for complex operands:
 VRa[31:16] = Imaginary Part
 VRa[15:0] = Real Part
 It ignores the VSTATUS[CPACK] bit.

VR7	Complex Input
VR6	Complex Input
VR4	Complex Input
VR2	Complex Output
VR1	Complex Output
VR0	Complex Output
#1-bit	1-bit immediate value

Opcode LSW: 1010 0001 0011 000I

Description This operation is used in the butterfly operation of the FFT:

```

If(VSTATUS[SAT] == 1){
    If(VSTATUS[RND] == 1){
        VR0H = rnd(sat(VR7H + VR2H)>>#1-bit);
        VR0L = rnd(sat(VR7L + VR2L)>>#1-bit);
        VR1L = rnd(sat(VR7L - VR2L)>>#1-bit);
        VR1H = rnd(sat(VR7H - VR2H)>>#1-bit);
        VR2H = rnd(sat(VR6H * VR4L - VR6L * VR4H)>> VSTATUS[SHIFTR]);
        VR2L = rnd(sat(VR6L * VR4L + VR6H * VR4H)>> VSTATUS[SHIFTR]);
    }else {
        VR0H = sat(VR7H + VR2H)>>#1-bit;
        VR0L = sat(VR7L + VR2L)>>#1-bit;
        VR1L = sat(VR7L - VR2L)>>#1-bit;
        VR1H = sat(VR7H - VR2H)>>#1-bit;
        VR2H = sat(VR6H * VR4L - VR6L * VR4H)>> VSTATUS[SHIFTR];
        VR2L = sat(VR6L * VR4L + VR6H * VR4H)>> VSTATUS[SHIFTR];
    }
}else { //VSTATUS[SAT] = 0
    If(VSTATUS[RND] == 1){
        VR0H = rnd((VR7H + VR2H)>>#1-bit);
        VR0L = rnd((VR7L + VR2L)>>#1-bit);
        VR1L = rnd((VR7L - VR2L)>>#1-bit);
        VR1H = rnd((VR7H - VR2H)>>#1-bit);
        VR2H = rnd((VR6H * VR4L - VR6L * VR4H)>> VSTATUS[SHIFTR]);
        VR2L = rnd((VR6L * VR4L + VR6H * VR4H)>> VSTATUS[SHIFTR]);
    }else {
        VR0H = (VR7H + VR2H)>>#1-bit;
        VR0L = (VR7L + VR2L)>>#1-bit;
        VR1L = (VR7L - VR2L)>>#1-bit;
        VR1H = (VR7H - VR2H)>>#1-bit;
        VR2H = (VR6H * VR4L - VR6L * VR4H)>> VSTATUS[SHIFTR];
        VR2L = (VR6L * VR4L + VR6H * VR4H)>> VSTATUS[SHIFTR];
    }
}

```

Sign-Extension is automatically done for the shift right operations

Flags This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if signed overflow is detected for add/sub calculation in which destination is VRxL
- OVFI is set if signed overflow is detected for add/sub calculation in which destination is VRxH
- The OVFR and OVFI flags are also set if, after shift right operation, the 32-bit

temporary result can't fit in 16-bit destination

Pipeline This is a two cycle instruction

Example See the example for [VCFFT10 VR7, VR6, VR3, VR2, VR1, VR0, #1-bit](#)

```

Sign-Extension is automatically done for the shift right operations

Flags

This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if signed overflow is detected for add/sub calculation in which destination is VRxL
- OVFI is set if signed overflow is detected for add/sub calculation in which destination is VRxH
- The OVFR and OVFI flags are also set if, after shift right operation, the 32-bit temporary result can't fit in 16-bit destination

Pipeline

This is a 2p cycle instruction.

Example

See the example for [VCFFT10 VR7, VR6, VR3, VR2, VR1, VR0, #1-bit](#)

See also

VCFFT6 VR3, VR2, VR1, VR0, #1-bit || VMOV32 mem32, VR1 *Complex FFT calculation instruction with Parallel Load*

Operands This operation assumes the following complex packing order for complex operands:
 VRa[31:16] = Imaginary Part
 VRa[15:0] = Real Part
 It ignores the VSTATUS[CPACK] bit.

VR3	Complex Input
VR2	Complex Output/Complex Input from previous operation
VR1	Complex Output/Complex Input from previous operation
VR0	Complex Output/Complex Input from previous operation
#1-bit	1-bit immediate value
mem32	Pointer to 32-bit memory location

Opcode LSW: 1110 0010 0000 0111
 MSW: 0010 010I mem32

Description This operation is used in the butterfly operation of the FFT:

```

If(VSTATUS[SAT] == 1){
  If(VSTATUS[RND] == 1){
    VR0H = rnd(sat(VR3H - VR2H)>>#1-bit);
    VR0L = rnd(sat(VR3L + VR2L)>>#1-bit);
    VR1H = rnd(sat(VR3H + VR2H)>>#1-bit);
    VR1L = rnd(sat(VR3L - VR2L)>>#1-bit);
  }else {
    VR0H = sat(VR3H - VR2H)>>#1-bit;
    VR0L = sat(VR3L + VR2L)>>#1-bit;
    VR1H = sat(VR3H + VR2H)>>#1-bit;
    VR1L = sat(VR3L - VR2L)>>#1-bit;
  }
}else { //VSTATUS[SAT] = 0
  If(VSTATUS[RND] == 1){
    VR0H = rnd((VR3H - VR2H)>>#1-bit);
    VR0L = rnd((VR3L + VR2L)>>#1-bit);
    VR1H = rnd((VR3H + VR2H)>>#1-bit);
    VR1L = rnd((VR3L - VR2L)>>#1-bit);
  }else {
    VR0H = (VR3H - VR2H)>>#1-bit;
    VR0L = (VR3L + VR2L)>>#1-bit;
    VR1H = (VR3H + VR2H)>>#1-bit;
    VR1L = (VR3L - VR2L)>>#1-bit;
  }
}
[mem32] = VR1;

```

Sign-Extension is automatically done for the shift right operations

Flags This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if signed overflow is detected for add/sub calculation in which destination is VRxL
- OVFI is set if signed overflow is detected for add/sub calculation in which destination is VRxH

Pipeline This is a 1/1-cycle instruction. The VCFFT and VMOV operations are completed in one cycle.

Example See the example for [VCFFT10 VR7, VR6, VR3, VR2, VR1, VR0, #1-bit](#)

VCFFT10 VR7, VR6, VR3, VR2, VR1, VR0 #1-bit || VMOV32 VR0, mem32 — *Complex FFT calculation instruction with Parallel Load* www.ti.com

VCFFT10 VR7, VR6, VR3, VR2, VR1, VR0 #1-bit || VMOV32 VR0, mem32 *Complex FFT calculation instruction with Parallel Load*

Operands This operation assumes the following complex packing order for complex operands:
 VRa[31:16] = Imaginary Part
 VRa[15:0] = Real Part
 It ignores the VSTATUS[CPACK] bit.

VR0	Complex Input
VR1	Complex Input
VR2	Complex Input
VR3	Complex Input
VR6	Complex Output
VR7	Complex Output
#1-bit	1-bit immediate value
mem32	pointer to 32-bit memory location

Opcode LSW: 1110 0010 1011 0000

Description This operation is used in the butterfly operation of the FFT:

```

If(VSTATUS[SAT] == 1){
  If(VSTATUS[RND] == 1){
    VR6L = rnd(sat(VR0H + VR3H)>>#1-bit);
    VR6H = rnd(sat(VR1H - VR2H)>>#1-bit);
    VR7L = rnd(sat(VR0H - VR3H)>>#1-bit);
    VR7H = rnd(sat(VR1H + VR2H)>>#1-bit);
  }else {
    VR6L = sat(VR0H + VR3H)>>#1-bit;
    VR6H = sat(VR1H - VR2H)>>#1-bit;
    VR7L = sat(VR0H - VR3H)>>#1-bit;
    VR7H = sat(VR1H + VR2H)>>#1-bit;
  }
}else { //VSTATUS[SAT] = 0
  If(VSTATUS[RND] == 1){
    VR6L = rnd((VR0H + VR3H)>>#1-bit);
    VR6H = rnd((VR1H - VR2H)>>#1-bit);
    VR7L = rnd((VR0H - VR3H)>>#1-bit);
    VR7H = rnd((VR1H + VR2H)>>#1-bit);
  }else {
    VR6L = (VR0H + VR3H)>>#1-bit;
    VR6H = (VR1H - VR2H)>>#1-bit;
    VR7L = (VR0H - VR3H)>>#1-bit;
    VR7H = (VR1H + VR2H)>>#1-bit;
  }
}
VR0 = [mem32];

```

Sign-Extension is automatically done for the shift right operations

Flags This instruction modifies the following bits in the VSTATUS register:

- OVFR is set if signed overflow is detected for add/sub calculation in which destination is VRxL
- OVFI is set if signed overflow is detected for add/sub calculation in which destination is VRxH

Pipeline This is a 1/1-cycle instruction. The VCFFT and VMOV operations are completed in one cycle.

Example See the example for [VCFFT10 VR7, VR6, VR3, VR2, VR1, VR0, #1-bit](#)

2.5.8 Galois Instructions

The instructions are listed alphabetically, preceded by a summary.

Table 2-17. Galois Field Instructions

Title	Page
VGFAcc VRa, VRb, #4-bit —Galois Field Instruction	330
VGFAcc VRa, VRb, VR7 —Galois Field Instruction	331
VGFAcc VRa, VRb, VR7 VMOV32 VRc, mem32 —Galois Field Instruction with Parallel Load	332

VPACK4 VRa, mem32, #2-bit —Byte Packing.....	339
VREVB VRa —Byte Reversal.....	340
VSHLMB VRa, VRb —Shift Left and Merge Right Bytes	341

VGFACC VRa, VRb, #4-bit *Galois Field Instruction*
Operands

VRb	General purpose register: VR0, VR1....VR7. Cannot be VR8
VRa	General purpose register: VR0, VR1....VR7. Cannot be VR8
#4-bit	4-bit Immediate Value

Opcode

```
LSW: 1110 0110 1000 0001
MSW: 0000 00aa abbb IIII
```

Description

Performs the following sequence of operations

```
If (I[0:0] == 1 )
    VRa[7:0] = VRa[7:0] ^ VRb[7:0]

If (I[1:1] == 1 )
    VRa[7:0] = VRa[7:0] ^ VRb[15:8]

If (I[2:2] == 1 )
    VRa[7:0] = VRa[7:0] ^ VRb[23:16]

If (I[3:3] == 1 )
    VRa[7:0] = VRa[7:0] ^ VRb[31:24]
```

Flags

This instruction does not affect any flags in the VSTATUS register

Pipeline

This is a single-cycle instruction

Example

See the Reed-Solomon algorithm implementation in the VCU library in controlSUITE

VITBM2 VR0
Code Rate 1:2 Branch Metric Calculation
Operands

Before the operation, the inputs are loaded into the registers as shown below. Each operand for the branch metric calculation is 16-bits.

Input Register	Value
VR0L	16-bit decoder input 0
VR0H	16-bit decoder input 1

The result of the operation is also stored in VR0 as shown below:

Output Register	Value
VR0L	16-bit branch metric 0 = VR0L + VR0H
VR0H	16-bit branch metric 1 = VR0L - VR0L

Opcode

LSW: 1110 0101 0000 1100

Description

Branch metric calculation for code rate = 1/2.

```
// SAT is VSTATUS[SAT]
// VR0L is decoder input 0
// VR0H is decoder input 1
//
// Calculate the branch metrics by performing 16-bit signed
// addition and subtraction
//
VR0L = VR0L + VR0H;      // VR0L = branch metric 0
VR0H = VR0L - VR0L;      // VR0H = branch metric 1
if (SAT == 1)
{
    sat16(VR0L);
    sat16(VR0H);
}
```

Flags

This instruction sets the real overflow flag, VSTATUS[OVFR] in the event of an overflow or underflow.

Pipeline

This is a single-cycle instruction.

VITBM2 VR0 || VMOV32 VR2, mem32 *Code Rate 1:2 Branch Metric Calculation with Parallel Load*
Operands

Before the operation, the inputs are loaded into the registers as shown below. Each operand for the branch metric calculation is 16-bits.

Input Register	Value
VR0L	16-bit decoder input 0
VR0H	16-bit decoder input 1
[mem32]	pointer to 32-bit memory location.

The result of the operation is stored in VR0 as shown below:

Output Register	Value
VR0L	16-bit branch metric 0 = VR0L + VR0H
VR0H	16-bit branch metric 1 = VR0L - VR0L
VR2	contents of memory pointed to by [mem32]

Opcode

LSW: 1110 0011 1111 1100
MSW: 0000 aaaa mem32

Description

Branch metric calculation for a code rate of 1/2 with parallel register load.

```
// SAT is VSTATUS[SAT]
// VR0L is decoder input 0
// VR0H is decoder input 1
//
// Calculate the branch metrics by performing 16-bit signed
// addition and subtraction
//
VR0L = VR0L + VR0H;      // VR0L = branch metric 0
VR0H = VR0L - VR0L;      // VR0H = branch metric 1
if (SAT == 1)
{
    sat16(VR0L);
    sat16(VR0H);
}
VR2 = [mem32]           // Load VR2L and VR2H with the next state metrics
```

Flags

This instruction sets the real overflow flag, VSTATUS[OVFR] in the event of an overflow or underflow.

Pipeline

Both operations complete in a single cycle.

VITBM3 VR0, VR1, VR2 Code Rate 1:3 Branch Metric Calculation
Operands

Before the operation, the inputs are loaded into the registers as shown below. Each operand for the branch metric calculation is 16-bits.

Input Register	Value
VR0L	16-bit decoder input 0
VR1L	16-bit decoder input 1
VR2L	16-bit decoder input 2

The result of the operation is stored in VR0 and VR1 as shown below:

Output Register	Value
VR0L	16-bit branch metric 0 = VR0L + VR1L + VR2L
VR0H	16-bit branch metric 1 = VR0L + VR1L - VR2L
VR1L	16-bit branch metric 2 = VR0L - VR1L + VR2L
VR1H	16-bit branch metric 3 = VR0L - VR1L - VR2L

Opcode

LSW: 1110 0101 0000 1101

Description

Calculate the four branch metrics for a code rate of 1/3.

```
// SAT is VSTATUS[SAT]
// VR0L is decoder input 0
// VR1L is decoder input 1
// VR2L is decoder input 2
//
// Calculate the branch metrics by performing 16-bit signed
// addition and subtraction
//
VR0L = VR0L + VR1L + VR2L; // VR0L = branch Metric 0
VR0H = VR0L + VR1L - VR2L; // VR0H = branch Metric 1
VR1L = VR0L - VR1L + VR2L; // VR1L = branch Metric 2
VR1H = VR0L - VR1L - VR2L; // VR1H = branch Metric 3
if(SAT == 1)
{
    sat16(VR0L);
    sat16(VR0H);
    sat16(VR1L);
    sat16(VR1H);
}
```

Flags

This instruction sets the real overflow flag, VSTATUS[OVFR] in the event of an overflow or underflow.

Pipeline

This is a 2p-cycle instruction. The instruction following VITBM3 must not use VR0 or VR1.

Example

Refer to the example for [VITDHADDSUB VR4, VR3, VR2, VRa](#).

VITDHADDSUB VR4, VR3, VR2, VRa Viterbi Double Add and Subtract, High

Operands

Before the operation, the inputs are loaded into the registers as shown below. This operation uses the branch metric stored in VRaH.

Input Register	Value
VR2L	16-bit state metric 0
VR2H	16-bit state metric 1
VRaH	Branch metric 1. VRa must be VR0 or VR1.

The result of the operation is stored in VR3 and VR4 as shown below:

Output Register	Value
VR3L	16-bit path metric 0 = VR2L + VRaH
VR3H	16-bit path metric 1 = VR2H - VRaH
VR4L	16-bit path metric 2 = VR2L - VRaH
VR4H	16-bit path metric 3 = VR2H + VRaH

Opcode

LSW: 1110 0101 0111 aaaa

Description

Viterbi high add and subtract. This instruction is used to calculate four path metrics.

```
//
// Calculate the four path metrics by performing 16-bit signed
// addition and subtraction
//
// Before this operation VR2L and VR2H are loaded with the state
// metrics and VRaH with the branch metric.
//
VR3L = VR2L + VRaH      // Path metric 0
VR3H = VR2H - VRaH      // Path metric 1
VR4L = VR2L - VRaH      // Path metric 2
VR4H = VR2H + VRaH      // Path metric 3
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

```

VITHSEL VRa, VRb, VR4, VR3 Viterbi Select High
Operands

Before the operation, the path metrics are loaded into the registers as shown below. Typically this will have been done using a Viterbi AddSub or SubAdd instruction.

Input Register	Value
VR3L	16-bit path metric 0
VR3H	16-bit path metric 1
VR4L	16-bit path metric 2
VR4H	16-bit path metric 3

The result of the operation is the new state metrics stored in VRa and VRb as shown below:

Output Register	Value
VRaH	16-bit state metric 0. VRa can be VR6 or VR8.
VRbH	16-bit state metric 1. VRb can be VR5 or VR7.
VT0	The transition bit is appended to the end of the register.
VT1	The transition bit is appended to the end of the register.

Opcode

```
LSW: 1110 0110 1111 0111
MSW: 0000 0000 bbbb aaaa
```

Description

This instruction computes the new state metrics of a Viterbi butterfly operation and stores them in the higher 16 bits of the VRa and VRb registers. To instead load the state metrics into the low 16-bits use the [VITLSEL](#) instruction.

```
T0 = T0 << 1      // Shift previous transition bits left
if (VR3L > VR3H)
{
    VRbH = VR3L; // New state metric 0
    T0[0:0] = 0; // Store the transition bit
}
else
{
    VRbH = VR3H; // New state metric 0
    T0[0:0] = 1; // Store the transition bit
}

T1 = T1 << 1      // Shift previous transition bits left
if (VR4L > VR4H)
{
    VRaH = VR4L; // New state metric 1
    T1[0:0] = 0; // Store the transition bit
}
else
{
    VRaH = VR4H; // New state metric 1
    T1[0:0] = 1; // Store the transition bit
}
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

Refer to the example for [VITDHADDSUB VR4, VR3, VR2, VRa](#).

[VITLSEL VRa, VRb, VR4, VR3](#)

VITHSEL VRa, VRb, VR4, VR3 || VMOV32 VR2, mem32 *Viterbi Select High with Parallel Load*
Operands

Before the operation, the path metrics are loaded into the registers as shown below. Typically this will have been done using a Viterbi AddSub or SubAdd instruction.

Input Register	Value
VR3L	16-bit path metric 0
VR3H	16-bit path metric 1
VR4L	16-bit path metric 2
VR4H	16-bit path metric 3
[mem32]	pointer to 32-bit memory location.

The result of the operation is the new state metrics stored in VRa and VRb as shown below:

Output Register	Value
VRaH	16-bit state metric 0. VRa can be VR6 or VR8.
VRbH	16-bit state metric 1. VRb can be VR5 or VR7.
VT0	The transition bit is appended to the end of the register.
VT1	The transition bit is appended to the end of the register.
VR2	Contents of the memory pointed to by [mem32].

Opcode

LSW: 1110 0011 1111 1111
MSW: bbbb aaaa mem32

Description

This instruction computes the new state metrics of a Viterbi butterfly operation and stores them in the higher 16-bits of the VRa and VRb registers. To instead load the state metrics into the low 16-bits use the [VITLSEL](#) instruction.

```

T0 = T0 << 1      // Shift previous transition bits left
if (VR3L > VR3H)
{
    VRbH = VR3L;  // New state metric 0
    T0[0:0] = 0;  // Store the transition bit
}
else
{
    VRbH = VR3H;  // New state metric 0
    T0[0:0] = 1;  // Store the transition bit
}

T1 = T1 << 1      // Shift previous transition bits left
if (VR4L > VR4H)
{
    VRaH = VR4L;  // New state metric 1
    T1[0:0] = 0;  // Store the transition bit
}
else
{
    VRaH = VR4H;  // New state metric 1
    T1[0:0] = 1;  // Store the transition bit
}

VR2 = [mem32];    // Load VR2

```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

Operands

Input	Output
VR0L	Low word of the destination register
mem16	Pointer to 16-bit memory location

Opcode

```
LSW: 1110 0010 1100 0101
MSW: 0000 0011 mem16
```

Description

VITSTAGE instruction performs 32 viterbi butterflies in a single cycle. This instructions does the following:

- Depends on the Initial 64 State Metrics of the current stage stored in registers VSM0 to VSM63
- Depends on the Branch Metrics Select configuration stored in registers VR2 to VR5
- Depends on the Computed Branch Metrics of the current stage stored in registers VR0 and VR1
- Computes the State Metrics for the next stage and updates registers VSM0 to VSM63. The 16-bit signed result of the computation is saturated if VSTATUS[SAT] == 1
- Computes transition bits for all 64 states and updates registers VT0 and VT1

```
VR0L = [mem16]
```

Flags

This instruction modifies the following bits in the VSTATUS register.

- OVFR is set if overflow is detected in the computation of a 16-bit signed result

Pipeline

This is a single-cycle instruction.

Example

```
;
; Viterbi K=7 CR = 1/3
;
;etc ...
;
_VITERBI_runK7CR13_stageA:
    VITSTAGE                ; Compute NSTATES/2 butterflies in

VTRACE mem32, VR0, VT0, VT1 *Viterbi Traceback, Store to Memory*
Operands

Before the operation, the path metrics are loaded into the registers as shown below using a Viterbi AddSub or SubAdd instruction.

Input Register	Value
VT0	transition bit register 0
VT1	transition bit register 1
VR0	Initial value is zero. After the first VTRACE, this contains information from the previous trace-back.

The result of the operation is the new state metrics stored in VRa and VRb as shown below:

Output Register	Value
[mem32]	Traceback result from the transition bits.

Opcode

```
LSW: 1110 0010 0000 1100
MSW: 0000 0000 mem32
```

Description

Trace-back from the transition bits stored in VT0 and VT1 registers. Write the result to memory. The transition bits in the VT0 and VT1 registers are stored in the following format by the VITLSEL and VITHSEL instructions:

VT0[31]	Transition bit [State 0]
VT0[30]	Transition bit [State 1]
VT0[29]	Transition bit [State 2]
...	...
VT0[0]	Transition bit [State 31]
VT1[31]	Transition bit [State 32]
VT1[30]	Transition bit [State 33]
VT1[29]	Transition bit [State 34]
...	...
VT1[0]	Transition bit [State 63]

```
//
// Calculate the decoder output bit by performing a
// traceback from the transition bits stored in the VT0 and VT1 registers
//
K = VSTATUS[K];
S = VR0[K-2:0];
VR0[31:K-1] = 0;
if (S < (1<<(K-2))) {
    temp[0] = VT0[(1 << (K-2)) - 1 - S];
} else {
    temp[0] = VT1[(1 << (K-1)) - 1 - S];
}
[mem32][0] = temp;
[mem32][31:1] = 0;

VR0[K-2:0] = 2*VR0[K-2:0] + temp[0];
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example

```
//
// Example traceback code fragment
```

```
//
// XAR5 points to the beginning of Decoder Output array
//
VCLEAR VR0
MOVL XAR5, *XAR4[0]

//
// To retrieve each original message:
// Load VT0/VT1 with the stored transition values
// and use VTRACE instruction
//

VMOV32 VT0, *--XAR3
VMOV32 VT1, *--XAR3
VTRACE *XAR5++, VR0, VT0, VT1

VMOV32 VT0, *--XAR3
VMOV32 VT1, *--XAR3
VTRACE *XAR5++, VR0, VT0, VT1
...
...etc for each VT0/VT1 pair
```

}else{
    VR1 = VR1>>1
    VR1[31:31] = temp[0] ;
    VR0[K-2:0] = 2*VR0[K-2:0] + temp[0];
}
```

Flags

This instruction does not modify any flags in the VSTATUS register.

Pipeline

This is a single-cycle instruction.

Example**See also** [VTRACE mem32, VR0, VT0, VT1](#)

VTRACE VR1, VR0, VT0, VT1 || VMOV32 VT0, mem32 Trace-back with Parallel Load
Operands

Input Register	Value
VT0	Traceback register
VT1	Traceback register
VR0	Decoded output bits register
VR1	Decoded output bits register
mem32	Pointer to 32-bit memory location

Opcode

```
LSW: 1110 0010 1011 0000
MSW: 0000 0001 mem32
```

Description
Trace-back with Parallel Load

```
K = VSTATUS[K];
S = VR0[K-2:0]; VR0[31:K-1] = 0;

if (S < (1 << (K-2)))
    temp[0] = VT0[(1<<(K-2))- 1 -S];
else
    temp[0] = VT1[(1<<(K-1))- 1 -S];

if(VSTATUS[OPACK]==0){
    VR1 = VR1<<1;
    VR1[0:0] = temp[0] ;
    VR0[K-2:0] = 2*VR0[K-2:0] + temp[0];
}else{
    VR1 = VR1>>1;
    VR1[31:31] = temp[0] ;
    VR0[K-2:0] = 2*VR0[K-2:0] + temp[0];
}

VT0 = [mem32]
```

Flags

This instruction does not affect any flags in the VSTATUS register.

Pipeline

This is a 1/1 cycle instruction. The VTRACE and VMOV32 instruction complete in a single cycle.

Example

```
;
; etc ...
;
.align      2
RPTB        _tb_loop_ovlp2, #12
VMOV32      VT0,  *--XAR3
VMOV32      VT1,  *--XAR3
VTRACE      VR1,VR0,VT0,VT1
|VMOV32      VT0,  *--XAR3
VMOV32      VT1,  *--XAR3
VTRACE      VR1,VR0,VT0,VT1
_tb_loop_ovlp2
;
; etc ...
;
```

2.6 Rounding Mode

This section details the rounding operation as applied to a right shift. When the rounding mode is enabled in the VSTATUS register, .5 will be added to the right shifted intermediate value before truncation. If rounding is disabled the right shifted value is only truncated. [Table 2-19](#) shows the bit representation of two values, 11.0 and 13.0. The columns marked Bit-1, Bit-2 and Bit-3 hold temporary bits resulting from the right shift operation.

Table 2-19. Example: Values Before Shift Right

	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Bit-1	Bit-2	Bit -3	Value
Val A	0	0	1	0	1	1	0	0	0	11.000
Val B	0	0	0	0	0	1	0	0	0	13.000

[Table 2-19](#) shows the intermediate values after the right shift has been applied to Val B. The columns marked Bit-1, Bit-2 and Bit-3 hold temporary bits resulting from the right shift operation.

Table 2-20. Example: Values after Shift Right

	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Bit-1	Bit-2	Bit -3	Value
Val A	0	0	1	0	1	1	0	0	0	11.000
Val B >> 3	0	0	0	0	0	1	1	0	1	1.625

When the rounding mode is enabled, .5 will be added to the intermediate result before truncation. [Table 2-21](#) shows the bit representation of Val A + Val (B >> 3) operation with rounding. Notice .5 is added to the intermediate shifted right value. After the addition, the bits in Bit-1, Bit-2 and Bit-3 are removed. In this case the result of the operation will be 13 which is the truncated value after rounding.

Table 2-21. Example: Addition with Right Shift and Rounding

	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Bit-1	Bit-2	Bit -3	Value
Val A	0	0	1	0	1	1	0	0	0	11.000
Val B >> 3	0	0	0	0	0	1	1	0	1	1.625
.5	0	0	0	0	0	0	1	0	0	0.500
Val A + Val B >> 3 + .5	0	0	1	1	0	1	0	0	1	13.125

When the rounding mode is disabled, the value is simply truncated. [Table 2-22](#) shows the bit representation of the operation Val A + (Val B >> 3) without rounding. After the addition, the bits in Bit-1, Bit-2 and Bit-3 are removed. In this case the result of the operation will be 12 which is the truncated value without rounding.

Table 2-22. Example: Addition with Rounding After Shift Right

	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Bit-1	Bit-2	Bit -3	Value
Val A	0	0	1	0	1	1	0	0	0	11.000
Val B >> 3	0	0	0	0	0	1	1	0	1	1.625
Val A + Val B >> 3	0	0	1	1	0	0	1	0	1	12.625

[Table 2-23](#) shows more examples of the intermediate shifted value along with the result if rounding is enabled or disabled. In each case, the truncated value is without .5 added and the rounded value is with .5 added.

Table 2-23. Shift Right Operation With and Without Rounding

Bit2	Bit1	Bit0	Bit -1	Bit -2	Value	Result with RND = 0	Result with RND = 1
0	1	0	0	0	2.00	2	2
0	0	1	1	1	1.75	1	2
0	0	1	1	0	1.50	1	2
0	0	1	0	1	1.25	1	1
0	0	0	1	1	0.75	0	1
0	0	0	1	0	0.50	0	1
0	0	0	0	1	0.25	0	0
0	0	0	0	0	0.00	0	0
1	1	1	1	1	-0.25	0	0
1	1	1	1	0	-0.50	0	0
1	1	1	0	1	-0.75	0	-1
1	1	1	0	0	-1.00	-1	-1
1	1	0	1	1	-1.25	-1	-1
1	1	0	1	0	-1.50	-1	-1
1	1	0	0	1	-1.75	-1	-2
1	1	0	0	0	-2.00	-2	-2

Trigonometric Math Unit (TMU)

The Trigonometric Math Unit (TMU) is a fully programmable block that enhances the instruction set of the C28-FPU to more efficiently execute common trigonometric and arithmetic operations.

The TMU module described in this reference guide is a Type 0 TMU. For a list of all devices with a TMU module of the same type and to determine differences between the types, see the *TMS320x28xx, 28xxx DSP Peripheral Reference Guide* ([SPRU566](#)). This document describes the architecture and instruction set of the C28x+FPU+TMU.

Topic	Page
3.1 Overview	380
3.2 Components of the C28x+FPU Plus TMU	380
3.3 Data Format	380
3.4 Pipeline	381
3.5 TMU Instruction Set	386

3.1 Overview

The TMU extends the capabilities of a C28x+FPU enabled processor by adding instructions to speed up the execution of common trigonometric and arithmetic operations listed in [Table 3-1](#).

Table 3-1. TMU Supported Instructions

Instructions	C Equivalent Operation
MPY2PIF32 RaH,RbH	$a = b * 2\pi$
DIV2PIF32 RaH,RbH	$a = b / 2\pi$
DIVF32 RaH,RbH,RcH	$a = b/c$
SQRTF32 RaH,RbH	$a = \sqrt{b}$
SINPUF32 RaH,RbH	$a = \sin(b*2\pi)$
COSPUF32 RaH,RbH	$a = \cos(b*2\pi)$
ATANPUF32 RaH,RbH	$a = \tan(b)/2\pi$
QUADF32 RaH,RbH,RcH,RdH	Operation to assist in calculating ATANPU2

3.2 Components of the C28x+FPU Plus TMU

The TMU extends the capabilities of the C28x+FPU processors by adding new instructions and, in some cases, leveraging existing FPU instructions to carry out common arithmetic operations used in control applications.

No changes have been made to existing instructions, pipeline or memory bus architecture. All TMU instructions use the existing FPU register set (R0H to R7H) to carry out their operations. A detailed explanation of the workings of the FPU can be found in the *TMS320C28x Floating Point Unit and Instruction Set Reference Guide* ([SPRUEO2](#)).

3.2.1 Interrupt Context Save and Restore

Since the TMU uses the same register set and flags as the FPU, there are no special considerations with regards to interrupt context save and restore.

If a TMU operation is executing when an interrupt occurs, the C28 can initiate an interrupt context switch without affecting the TMU operation. The TMU will continue to process the operation to completion. Even though most TMU operations are multi-cycle, the TMU operation will have completed by the time register context save operations for the FPU are commenced. When restoring FPU registers, you must make sure that all TMU operations are completed before restoring any register used by another TMU operation.

3.3 Data Format

The encoding of the floating-point formats is given in [Table 3-2](#).

Table 3-2. IEEE 32-Bit Single Precision Floating-Point Format

S32	E32 (7:0)	M32 (22:0)	Value (V)
0	0	0	Zero ($V = 0$)
1	0	0	Negative Zero ($V = -0$)
0 +ve 1 -ve	0	non zero	De-normalized ($V = (-1)^S * 2^{(-126)} * (0.M)$)
0 +ve 1 -ve	1 to 254	0 to 0x7FFFFFFF	Normal Range ($V = (-1)^S * 2^{(E-127)} * (1.M)$)
0	254	0x7FFFFFFF	Positive Max ($V = +Max$)
1	254	0x7FFFFFFF	Negative Max ($V = -Max$)
0	max=255	0	Positive Infinity ($V = +Infinity$)
1	max=255	0	Negative Infinity ($V = -Infinity$)
x	max=255	non zero	Not A Number ($V = NaN$)

The treatment of the various IEEE floating-point numerical formats for this TMU is the same as the FPU implementation given below:

Negative Zero: All TMU operations generate a positive ($S==0$, $E==0$, $M==0$) zero, never a negative zero if the result of the operation is zero. All TMU operations treat negative zero operations as zero.

De-Normalized Numbers: A de-normalized operand ($E==0$, $M!=0$) input is treated as zero ($E==0$, $M==0$) by all TMU operations. TMU operations never generate a de-normalized value.

Underflow: Underflow occurs when an operation generates a value that is too small to represent in the given floating-point format. Under such cases, a zero value is returned. If a TMU operation generates an underflow condition, then the latched underflow flag (LUF) is set to 1. The LUF flag will remain latched until cleared by the user executing an instruction that clears the flag.

Overflow: Overflow occurs when an operation generates a value that is too large to represent in the given floating-point format. Under such cases, a \pm Infinity value is returned. If a TMU operation generates an overflow condition, then the latched overflow flag (LVF) is set to 1. The LVF flag will remain latched until cleared by the user executing an instruction that clears the flag.

Rounding: There are various rounding formats supported by the IEEE standard. Rounding has no meaning for TMU operations (rounding is inherent in the implementation). Hence rounding mode is ignored by TMU operations.

Infinity and Not a Number (NaN): An NaN operand ($E==\text{max}$, $M!=0$) input is treated as Infinity ($E==\text{max}$, $M==0$) for all operations. TMU operations will never generate a NaN value but Infinity instead.

3.4 Pipeline

The TMU enhances the instruction set of the C28-FPU and, therefore, operates the C28x pipeline in the same fashion as the FPU. For a detailed explanation on the working of the pipeline, see the *TMS320C28x Floating Point Unit and Instruction Set Reference Guide* ([SPRUEO2](#)).

3.4.1 Pipeline and Register Conflicts

In addition to the restrictions mentioned in the *TMS320C28x Floating Point Unit and Instruction Set Reference Guide* ([SPRUEO2](#)), the TMU places the following restrictions on its instructions:

Example 3-1. SINPUF32 Operation (4p cycles)

```
SINPUF32 RaH,RbH ; Value in registers RbH read in this cycle.
Instruction1      ; Instructions 1-3 cannot operate on register RaH.
Instruction2      ; Instructions 1-3 can operate on register RbH.
Instruction3      ; Instructions 1-3 can be any TMU/FPU/VCU/CPU operation.
Instruction4      ; Result in RaH usable by Instruction 4.
```

Example 3-2. COSPUF32 Operation (4p cycles)

```
COSPUF32 RaH,RbH ; Value in registers RbH read in this cycle.
Instruction1      ; Instructions 1-3 cannot operate on register RaH.
Instruction2      ; Instructions 1-3 can operate on register RbH.
Instruction3      ; Instructions 1-3 can be any TMU/FPU/VCU/CPU operation.
Instruction4      ; Result in RaH usable by Instruction4.
```

Example 3-3. ATANPUF32 Operation (4p cycles)

```
ATANPUF32 RaH,RbH ; Value in registers RbH read in this cycle.
Instruction1      ; Instructions 1-3 cannot operate on register RaH.
Instruction2      ; Instructions 1-3 can operate on register RbH.
Instruction3      ; Instructions 1-3 can be any TMU/FPU/VCU/CPU operation.
                  ; Result, LVF flag updated on Instruction3 (4th cycle).
Instruction4      ; Result in RaH usable by Instruction4.
```

Example 3-4. DIVF32 Operation (5p cycles)

```

DIVF32 RaH,RbH,RcH ; Value in registers RbH & RcH read in this cycle.
Instruction1        ; Instructions 1-4 cannot operate on register RaH.
Instruction2        ; Instructions 1-4 can operate on register RbH & RcH.
Instruction3        ; Instructions 1-4 can be any TMU/FPU/VCU/CPU operation.
Instruction4        ; Result, LVF and LUF flags updated on Instruction4 (5th cycle).
Instruction5        ; Result in RaH usable by Instruction5.

```

Example 3-5. SQRTF32 Operation (5p cycles)

```

SQRTF32 RaH,RbH    ; Value in register RbH read in this cycle.
Instruction1        ; Instructions 1-4 cannot operate on register RaH.
Instruction2        ; Instructions 1-4 can operate on register RbH.
Instruction3        ; Instructions 1-4 can be any TMU/FPU/VCU/CPU operation.
Instruction4        ; Result, LVF flag updated on Instruction4 (5th cycle).
Instruction5        ; Result in register RaH usable by Instruction5.

```

Example 3-6. QUADF32 Operations (5p cycles)

```

QUADF32 RaH,RbH,RcH,RdH
Instruction1        ; Value in registers RcH & RdH read in this cycle.
Instruction2        ; Instructions 1-4 cannot operate on registers RaH & RbH.
Instruction3        ; Instructions 1-4 can operate on register RbH.
Instruction4        ; Instructions 1-4 can be any TMU/FPU/VCU/CPU operation.
Instruction5        ; Result, LVF and LUF flags updated on Instruction4 (5th cycle).
Instruction5        ; Result in registers RaH & RbH usable by Instruction5.

```

3.4.2 Delay Slot Requirements

The Delay slot requirements for the TMU instructions are presented in [Table 3-3](#).

Table 3-3. Delay Slot Requirements for TMU Instructions

Case	Description
1	Any Single Cycle FPU operation (including any memory load/store operation) SINPUF32/COSPUF32/ATANPUF32/QUADF32/MPY2PIF32/DIV2PIF32/DIVF32/SQRTF32
2	All FPU 2p-cycle operations MPY/ADD/SUB/.... NOP NOP SINPUF32/COSPUF32/ATANPUF32/QUADF32/MPY2PIF32/DIV2PIF32/DIVF32/SQRTF32
3	SINPUF32/COSPUF32/ATANPUF32 NOP NOP NOP All TMU or FPU operations
4	QUADF32/DIVF32/SQRTF32 NOP NOP NOP NOP All TMU or FPU operations
Special Cases Involving MPY2PIF32/DIV2PIF32	
5	MPY2PIF32/DIV2PIF32 NOP SINPUF32/COSPUF32
6	MPY2PIF32/DIV2PIF32 NOP NOP ATANPUF32/QUADF32/DIVF32/SQRTF32
7	MPY2PIF32/DIV2PIF32 NOP NOP All FPU operations
8	MPY2PIF32/DIV2PIF32 NOP MOV32 mem,RxH; Special case: Store result of MPY2PIF32/DIV2PIF32 to memory (but does not include MOV32 operation between CPU and FPU registers).

Notes:

The “NOPs” can be any other FPU, TMU, VCU or CPU operation that does not conflict with the current active TMU operation (does not use same destination register). For example,

Example 3-7. Use of Non-Conflicting Instructions in Delay Slots

```

SINPUF32    R0H,R1H
COSPUF32    R2H,R1H
MOV32       R4H,@VarA
MOV32       R5H,@VarB
ADDF32      R3H,R4H,R0H ; SINPUF32 value (R0H) used here
ADDF32      R7H,R5H,R2H ; COSPUF32 value (R2H) used here

```

The delay FPU slot requirements apply to the operation whereby the destination register value is subsequently used by the TMU operation. For example, in the following case, a parallel MPY and MOV operation precedes the TMU operation and the result from MPY operation is used, then two delay slots are required (Case 2 of [Table 3-3](#)):

Example 3-8. Delay Slot Requirement for TMU Instructions That Use Results of Prior FPU Instructions

```
MPYF32    R3H,R2H,R1H
| | MOV32  R4H,@varA
NOP
NOP
SINPUF32  R6H,R3H
```

If however the result of the parallel MOV operation is used, then no delay slots are required since the MOV will complete in a single cycle. (Case 1 of [Table 3-3](#)):

Example 3-9. FPU Instruction Followed by a Non-Dependent TMU Instruction

```
MPYF32    R3H,R2H,R1H
| | MOV32  R4H,@varA
SINPUF32  R6H,R4H
```

3.4.3 Effect of Delay Slot Operations on the Flags

The LVF and LUF flags can only be set. If multiple operations (from FPU or TMU) try to set the flags, the operations on the flags are ORed together. Operations that set the LVF or LUF flags (either FPU or TMU) are allowed in delay slots. For example, the following sequence of operations is valid:

Example 3-10. Valid Back-to-Back Instructions That may Set the LVF, LUF Flag

```
MPY2PIF32 R0H,R0H
MPY2PIF32 R1H,R1H
```

If the SETFLG, SAVE, RESTORE, MOVST0, or loading and storing of the STF register, operations try to modify the state of the LVF, LUF flags while a TMU or any other FPU operation is trying to set the flags, the LUV, LVF flags are undefined. This can only occur if the SAVE, SETFLG, RESTORE, MOVST0, or loading and storing of the STF register, operations are placed in the delay slots of the pipeline operations; this should be avoided. This also applies to ZF and NF flags, which are not affected by TMU operations.

3.4.4 Multi-Cycle Operations in Delay Slots

A multi-cycle operation like RET, BRANCH, CALL is equivalent to a minimum four NOPs. For example, the code shown in [Example 3-11](#) returns the correct value because LRETR takes a minimum of four cycles to execute (equivalent to four NOPs):

Example 3-11. Multi-Cycle Operation in the Delay Slot of a TMU Instruction

```
DIVF32 R0H,R2H,R1H
LRETR
```

3.4.5 Moves From FPU Registers to C28x Registers

When transferring from floating-point unit registers (result of an FPU or TMU operation) to the C28x CPU register, additional pipeline alignment is required as shown in [Example 3-12](#).

Example 3-12. Floating-Point to C28x Register Software Pipeline Alignment

```
; SINPUF32: Per unit sine: 4 pipeline cycle operation
; An alignment cycle is required before copying R0H to ACC
SINPUF32 R0H,R1H
NOP                ; Delay Slot 1
NOP                ; Delay Slot 2
NOP                ; Delay Slot 3
NOP                ; Alignment cycle
MOV32 @ACC,R0H
```

3.5 TMU Instruction Set

This section describes the assembly language instructions of the TMU.

3.5.1 Instruction Descriptions

This section provides detailed information on the instruction set. Each instruction may present the following information:

- Operands
- Opcode
- Description
- Exceptions
- Pipeline
- Examples
- See also

The example INSTRUCTION is shown to familiarize you with the way each instruction is described. The example describes the kind of information you will find in each part of the individual instruction description and where to obtain more information. TMU instructions follow the same format as the C28x and the C28x+FPU; the source operand(s) are always on the right and the destination operand(s) are on the left.

The explanations for the syntax of the operands used in the instruction descriptions for the C28x TMU are given in [Table 3-4](#). For information on the operands of standard C28x instructions, see the *TMS320C28x CPU and Instruction Set Reference Guide* ([SPRU430](#)).

Table 3-4. Operand Nomenclature

Symbol	Description
#16FHi	16-bit immediate (hex or float) value that represents the upper 16-bits of an IEEE 32-bit floating-point value. Lower 16-bits of the mantissa are assumed to be zero.
#16FHiHex	16-bit immediate hex value that represents the upper 16-bits of an IEEE 32-bit floating-point value. Lower 16-bits of the mantissa are assumed to be zero.
#16FLoHex	A 16-bit immediate hex value that represents the lower 16-bits of an IEEE 32-bit floating-point value
#32Fhex	32-bit immediate value that represents an IEEE 32-bit floating-point value
#32F	Immediate float value represented in floating-point representation
#0.0	Immediate zero
#RC	16-bit immediate value for the repeat count
*(0:16bitAddr)	16-bit immediate address, zero extended
CNDF	Condition to test the flags in the STF register
FLAG	Selected flags from STF register (OR) 11 bit mask indicating which floating-point status flags to change
label	Label representing the end of the repeat block
mem16	Pointer (using any of the direct or indirect addressing modes) to a 16-bit memory location
mem32	Pointer (using any of the direct or indirect addressing modes) to a 32-bit memory location
RaH	R0H to R7H registers
RbH	R0H to R7H registers
RcH	R0H to R7H registers
RdH	R0H to R7H registers
ReH	R0H to R7H registers
RfH	R0H to R7H registers
RB	Repeat Block Register
STF	FPU Status Register
VALUE	Flag value of 0 or 1 for selected flag (OR) 11 bit mask indicating the flag value; 0 or 1

INSTRUCTION dest1, source1, source2 Short Description

Operands

dest1	Description for the 1st operand for the instruction
source1	Description for the 2nd operand for the instruction
source2	Description for the 3rd operand for the instruction

Each instruction has a table that gives a list of the operands and a short description. Instructions always have their destination operand(s) first followed by the source operand(s).

Opcode This section shows the opcode for the instruction.

Description Detailed description of the instruction execution is described. Any constraints on the operands imposed by the processor or the assembler are discussed.

Restrictions Any constraints on the operands or use of the instruction imposed by the processor are discussed.

Pipeline This section describes the instruction in terms of pipeline cycles.

Example Examples of instruction execution. If applicable, register and memory values are given before and after instruction execution. All examples assume the device is running with the OBJMODE set to 1. Normally the boot ROM or the c-code initialization will set this bit.

See Also Lists related instructions.

3.5.2 Common Restrictions

For all the TMU instructions, the inputs are conditioned as follows (LVF, LUF are not affected):

- Negative zero is treated as positive zero
- Positive or negative denormalized numbers are treated as positive zero
- Positive and negative NaN are treated as positive and negative infinity respectively

3.5.3 Instructions

The instructions are listed alphabetically.

Table 3-5. Summary of Instructions

Title	Page
MPY2PIF32 RaH, RbH — 32-Bit Floating-Point Multiply by Two Pi	388
DIV2PIF32 RaH, RbH — 32-Bit Floating-Point Divide by Two Pi	389
DIVF32 RaH, RbH, RcH — 32-Bit Floating-Point Division	390
SQRTF32 RaH, RbH — 32-Bit Floating-Point Square Root	392
SINPUF32 RaH, RbH — 32-Bit Floating-Point Sine (per unit)	393
COSPUF32 RaH, RbH — 32-Bit Floating-Point Cosine (per unit)	395
ATANPUF32 RaH, RbH — 32-Bit Floating-Point ArcTangent (per unit)	397
QUADF32 RaH, RbH, RcH — Quadrant Determination Used in Conjunction With ATANPUF32()	398

MPY2PIF32 RaH, RbH 32-Bit Floating-Point Multiply by Two Pi
Operands

RaH	Floating-point destination register (R0H to R7H)
RbH	Floating-point source register (R0H to R7H)

Opcode

LSW	1110 0010 0111 0000
MSW	0000 0000 00bb baaa

Description

This operation is similar to the MPYF32 operation except that the second operand is the constant value 2pi:

$$RaH = RbH * 2\pi$$

This operation is used in converting Per Unit values to Radians. Per Unit values are used in control applications to represent normalized radians:

Per Unit	Radians
1.0	2pi
0.0	0
1.0	2pi

$$2\pi = 6.28318530718 = 1.570796326795 * 2^2$$

In IEEE 32-bit Floating point format:

$$S = 0 \ll 31 = 0x00000000$$

$$E = (2 + 127) \ll 23 = 129 \ll 23 = 0x40800000$$

$$M = (1.570796326795 * 2^{23}) \& 0x007FFFFFFF = 0x00490FDB$$

$$2\pi = S+E+M = 0x40C90FDB$$

Flags

Modified	No	No	No	No	No	No	Yes

Restrictions

```

If( RaH result is too big for floating-point number, Ea > 255 ){
    RaH = ±Infinity
    LVF = 1;
}

```

Pipeline

Instruction takes 2 pipeline cycles to execute if followed by either SINPUF32, COSPUF32 or MOV32 mem, Rx operations and 3 pipeline cycles for all other operations (FPU or TMU).

Example

```

;; Convert Per Unit value to Radians:
MOV32    R0H,@PerUnit    ; R0H = Per Unit value
MPY2PIF32 R0H,R0H        ; R0H = R0H * 2pi
NOP      ; pipeline delay
MOV32    @Radians,R0H    ; store Radian result
; 4 cycles

```

DIV2PIF32 RaH, RbH 32-Bit Floating-Point Divide by Two Pi
Operands

RaH	Floating-point destination register (R0H to R7H)
RbH	Floating-point source register (R0H to R7H)

Opcode

LSW	1110 0010 0111 0001
MSW	0000 0000 00bb baaa

Description

This operation is similar to the MPYF32 operation except that the second operand is the constant value $1/2\pi$:

$$\text{RaH} = \text{RbH} * 1/2\pi$$

This operation is used in converting Radians to Per unit values. Per unit values are used in control representing normalized Radians:

Per Unit	Radians
1.0	2π
0.0	0
-1.0	-2π

In IEEE 32-bit Floating point format:

$$1/2\pi = 0.1591549430919 = 1.273239544735 * 2^{-3}$$

$$S = 0 \ll 31 = 0x00000000$$

$$E = (-3+127) \ll 23 = 124 \ll 23 = 0x3E000000$$

$$M = (1.273239544735 * 2^{23}) \& 0x007FFFFFFF = 0x0022F983$$

$$1/2\pi = S+E+M = 0x3E22F983$$

Opcode

LSW	1110 0010 0111 1000
MSW	0000 0000 00bb baaa

Description

This instruction performs the following equivalent operation:

$$\text{PerUnit} = \text{fraction}(\text{RbH})$$

$$\text{RaH} = \sin(\text{PerUnit} \times 2\pi)$$

In control applications radians are usually normalized to the range of -1.0 to 1.0.

Per Unit	Radians
1.0	2pi
0.0	0
-1.0	-2pi

The operation takes the fraction of the input value RbH. This equates to the cosine waveform repeating itself every 2pi radians

RbH	Per Unit	Radians	Sine Value
2.0	0.0	0	0.0
1.75	0.75	3pi/2	-1.0
1.5	0.5	pi	0.0
1.25	0.25	pi/2	1.0
1.0	0.0	0	0.0
0.75	0.75	3pi/2	-1.0
0.5	0.5	pi	0.0
0.25	0.25	pi/2	1.0
0.0	0.0	0	0.0
-0.25	-0.25	-pi/2	-1.0
-0.5	-0.5	-pi	0.0
-0.75	-0.75	-3pi/2	1.0
-1.0	0.0	0	0.0
-1.25	-0.25	-pi/2	-1.0
-1.5	-0.5	-pi	0.0
-1.75	-0.75	-3pi/2	1.0
-2.0	0.0	0	0.0

Flags

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	No

Restrictions If the input value is too small ($\leq 2^{-33}$) or too big ($\geq 2^{22}$), then the output will be returned as 0.0 (no flags affected).

Pipeline Instruction takes 4 pipeline cycles to execute.

Example

```
;; Convert Radian value to PerUnit value and
;; calculate Sin value:
MOV32      R0H,@RadianValue  ; R0H = Radian value
DIV2PIF32  R1H,R0H
                                     ; R1H=R0H/2pi= Per Unit Value

ATANPUF32 RaH, RbH 32-Bit Floating-Point ArcTangent (per unit)
Operands

RaH	Floating-point destination register (R0H to R7H)
RbH	Floating-point source register (R0H to R7H)

Opcode

LSW	1110 0010 0111 1010
MSW	0000 0000 00bb baaa

Description

This instruction computes the arc tangent of a given value and returns the result as a per-unit value:

$$\text{PerUnit} = \text{atan}(\text{RbH})/2\pi$$

The operation limits the input range of the input value RbH to:

$$-1.0 \leq \text{RbH} \leq 1.0$$

Values outside this range return 0.125 as follows:

RbH	Per Unit	Radians	ATANPU Value	LVF Flag
>1.0	0.125	$\pi/4$	0.125	1
1.0	0.125	$\pi/4$	0.125	
0.0	0.0	0	0.0	
-1.0	-0.125	$-\pi/4$	-0.125	
<-1.0	-0.125	$-\pi/4$	-0.125	1

Flags

Flag	TF	ZI	NI	ZF	NF	LUF	LVF
Modified	No	No	No	No	No	No	Yes

Pipeline

Instruction takes 4 pipeline cycles to execute.

Example

```
;; Calculate ATAN and generate Per Unit value and
;; convert to Radians:
MOV32    R0H,@AtanValue    ; R0H = Atan Value
ATANPUF32 R1H,R0H          ; R1H = ATANPU(R0H)
NOP                      ; pipeline delay
NOP                      ; pipeline delay
NOP                      ; pipeline delay
MPY2PIF32 R2H,R1H          ; R2H = R1H * 2pi
                        ;      = Radian value
NOP                      ; pipeline delay
MOV      @RadianValue,R2H  ; Store result
                        ; 8 cycles
```

QUADF32 RaH, RbH, RcH *Quadrant Determination Used in Conjunction With ATANPUF32()*
Operands

RaH	Floating-point destination register (R0H to R7H)
RbH	Floating-point destination register (R0H to R7H)

RdH	Floating-point source register (R0H to R7H)

Opcode

LSW	1110 0010 0111 1100
MSW	0000 dddc ccbb baaa

Description

This operation, in conjunction with atanpu(), is used in calculating atanpu2() for a full circle:

RdH = X value

RcH = Y value

RbH = Ratio of X & Y

RaH = Quadrant value (0.0, ± 0.25 , ± 0.5)

[Calculation of RaH \(Quadrant\) and RbH \(Ratio\) Based on RcH \(Y\) and RdH \(X\) Values](#) shows how the values RaH and RbH are generated based on the contents of RbH and RcH.

The algorithm for this instruction is as follows:

```

if( (fabs(RcH(Y)) == 0.0) & (fabs(RdH(X)) == 0.0) ) {
    RaH(Quadrant) = 0.0;
    RbH(Ratio)    = 0.0;
}else if( fabs(RcH(Y)) <= fabs(RdH(X)) ) {
    RbH(Ratio) = RcH(Y) / RdH(X);
    if( RdH(X) >= 0.0 )
        RaH(Quadrant) = 0.0;
    else {
        if( RcH(Y) >= 0.0 )
            RaH(Quadrant) = 0.5;
        else
            RaH(Quadrant) = -0.5;
    }
}else {
    if( RcH(Y) >= 0.0 )
        RaH(Quadrant) = 0.25;
    else
        RaH(Quadrant) = -0.25;
    RbH(Ratio) = - RdH(X) / RcH(Y);
}

```

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
