## DNA DAMAGE

## IN CANCER AND AGING

# LEZIONE

a cura di

**Fabrizio D'Adda di Fagagna**,  
ricercatore AIRC presso IFOM

per gli studenti del Corso di Laurea in

**Genomica funzionale**

Insegnamento

**Biologia degli RNA non codificanti**

ospita il docente **Stefan Schoeftner**

L'appuntamento fa parte di AIRCampus, il progetto con cui  
AIRC incontra gli studenti delle università italiane.  
*Affrontiamo il cancro. Insieme.*

# Real time PCR

**...follow the accumulation of PCR products during increasing cycle numbers in “real-time” using a detection system (gel electrophoresis non necessary)**

# Let's compare semiquantitative PCR and quantitative PCR

**Example: gene expression analysis**

- **Semi-quantitative PCR**
- **Technical details on quantitative PCR**
- **Quantitative PCR and quantitative gene expression analysis**

# Visualization of PCR products by agarose gel electrophoresis:

## “End point PCR”:

PCR performed with increasing cycle numbers that bring PCR to plateau phase.

**Example: results indicate that plateau phase is reached at cycle number 30 = end point**

Note: we do not have information on amplification between cycle number 26 and 29. It might be that plateau phase is reached at cycle number 26, 27, 28 or 29.

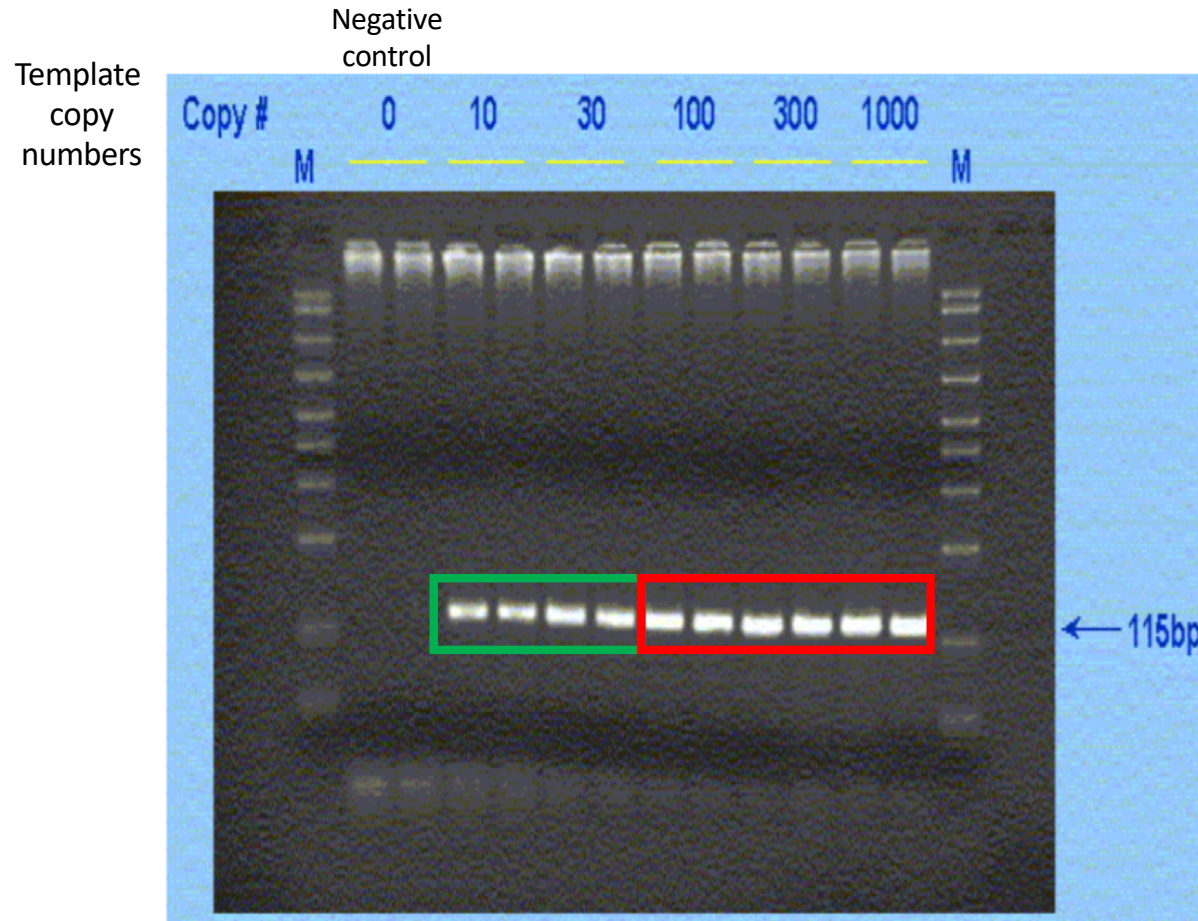

—PCR product (desired)  
— Alternative, non desired PCR products; accumulate with increasing cycle number

# Semi-quantitative PCR and gene expression analysis

## Traditional End-Point PCR = Researcher decides cycle number

- has a narrow dynamic range (<2 logs) → **SEMI-QUANTITATIVE**
- when multiple samples are used to perform PCR, template number can be different in different samples → a fixed cycle number suitable for all samples is difficult to determine

Copy number of PCR template

PCR conditions: **32 cycles**

Amplification in **dynamic range**: increase in template number results an increased amount of PCR product, visible by gel electrophoresis → **semi-quantitative information**

Amplification out of dynamic range: increase in template number (or cycle number – see before!!) does not result an increased amount of PCR product, visible by gel electrophoresis – → max. amplification already reached with 100 template-copies  
→ **No quantitative information between 100 and 300 copies as template**

# Semi-quantitative PCR and gene expression analysis

## Traditional End-Point PCR

End-point PCR:

- ideal to give qualitative information (for example amplification of a mutation using specific primers or presence of pathogen)
- Only limited quantitative information possible

# Semi-quantitative PCR and gene expression analysis

**Adjust ideal number of cycles – can only be experimentally defined (laborious)**

**Get better quantitative information from classic PCR:**

- Optimize PCR conditions:

- Test for ideal end-point of PCR (example 25)
- Optimize the amount of original template used for PCR

Time  
Waste of primary material  
Costs  
Variability

# Technical details on quantitative PCR

**Follow PCR product amplification in real-time (RT-PCR)**

**Obtaining QUANTITATIVE information from PCR**

**Follow the amplification of PCR amplicons in “REAL-TIME” in all biological samples analyzed  
= REAL TIME PCR**

# Technical details on quantitative PCR

**Real-Time PCR has become a cornerstone of molecular biology:**

- **Gene expression analysis**
  - Cancer research
  - Drug research
- **Disease diagnosis and management**
  - Viral quantification
- **Food testing**
  - Percent GMO food
- **Animal and plant breeding**
  - Gene copy number

**For all applications that require the quantification of RNA/DNA sequences**

# Technical details on quantitative PCR

## Real-time PCR

- Eliminate use of gel electrophoresis
- Increase reproducibility
- Enable use of internal controls/standards
- Reduce turnaround time
- Increase throughput; 96 well format, 384 well format
- Reduce sample amount usage
- Results expressed as **numbers**

# Real-Time PCR Chemistry

Strategies to follow PCR product generation

SYBR<sup>®</sup> Green I dye

Binds double  
stranded DNA

Fluorogenic 5'  
Nuclease Assay

Uses a TaqMan<sup>®</sup> probe

# 1. SYBR<sup>®</sup> Green I Dye Assay Chemistry

Classic PCR setup with addition of SYBR Green:  
SYBR Green is a green fluorescent cyanine dye that has high affinity for double-stranded DNA. The mode of binding is believed to be a combination of DNA intercalation and external binding. When bound, SYBR absorbs at a wavelength around 497 nm and emits fluorescence around 520 nm.

Denaturation  
Annealing

1. Dye in solution emits  
low fluorescence

2. Emission of the  
fluorescence by binding

DNA synthesis  
Detection of  
emission of  
fluorescence

***Fluorescence emission is increasing with increasing of PCR cycles***

# Basics of real-time PCR measurements

**Every PCR cycle:  
Excitation of SYBR green  
(497nm) + measurement  
of emission from SYBR  
green (520nm)**

Fig. 1.2. Representation of Optical Detection System layout.

# Basics of real-time PCR measurements

## AMPLIFICATION BLOT

## Quantitative information

# Basics of real-time PCR measurements – Melting curve

## MELTING CURVE ANALYSIS (HRM = high resolution melting score)

The temperature-dependent dissociation between two DNA-strands can be measured using a DNA-intercalating fluorophore such as SYBR green, or fluorophore-labelled DNA probes. In the case of SYBR green (emitting fluorescence 1000-fold more intensely while intercalated in the minor groove of two strands of DNA), the dissociation of the DNA during heating is measurable **by the large reduction in fluorescence that results**.

**The temperature at which 50% of DNA is denatured is known as the melting temperature.**

Generation of melting curves, melting peaks, and HRM scores. Melting curves (top panel) are generated by graphing Fluorescence against Temperature. Fluorescence declines as the DNA melts. DNA melting is visualized through the use of a saturating duplex-dependent DNA intercalating dye. As the DNA melts, the dye is released; unbound dye does not fluoresce. Melting peaks (bottom panel) are generated by taking the negative derivative of Fluorescence with respect to Temperature and graphing these values against Temperature ( $-2 dF/dT$  vs  $T$ ).

**Melting curve is determined after the last cycle of PCR:**

- PCR machine heats up PCR products from 0°C to 100°C
- Dissociation of SYBR from dsDNA filaments is measured
- IF PCR HAS AMPLIFIED SPECIFICALLY A SPECIFIC REGION → ALL DNA MOLECULES WILL MELT AT A SPECIFIC TEMPERATURE → **melting temperature is determined by DNA sequence!!!**
- IF YOU RUN PCR PRODUCT ON AGAROSE GEL, ONLY **ONE** BAND WILL BE VISIBLE

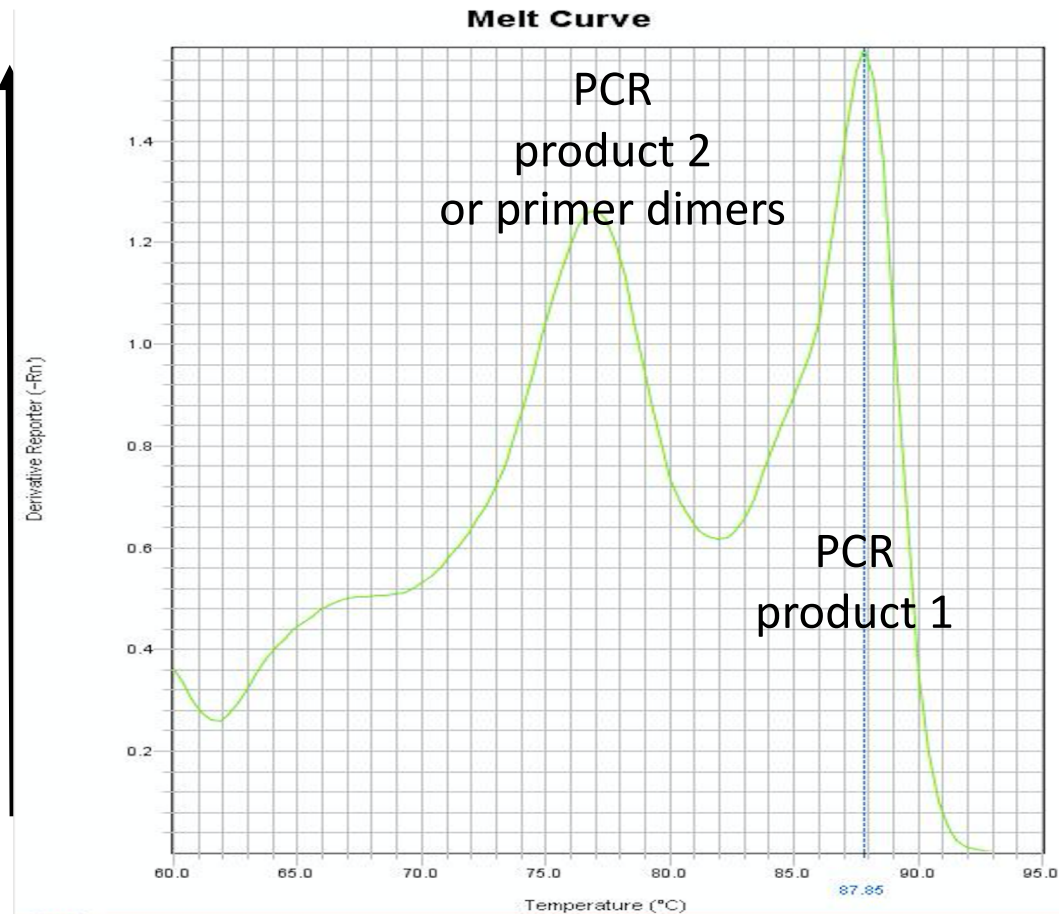

# Basics of real-time PCR measurements

## MELTING CURVE ANALYSIS

Melting curve is determined after the last cycle of PCR:

- PCR machine heats up PCR products from 0°C to 100°C
- Dissociation of DNA filaments is measured
- **IF PCR HAS AMPLIFIED MULTIPLE FRAGMENTS IN A NON\_SPECIFIC MANNER THE MELTING CURVE ANALYSIS WILL IDENTIFY MORE THEN ONE PEAK (PCR primers are not specific!!)**
- Example: IF YOU RUN PCR PRODUCT ON AGAROSE GEL, MORE THAN ONE BAND WILL BE VISIBLE

dissociation of ds DNA

Agarose gel

AREA UNDER PEAKs

= SYBR incorporation

Here: signals from different types of dsRNA  
(not only target amplicon)

**MELTING CURVE ANALYSIS GIVE QUALITATIVE INFORMATION OF THE REAL-TIME PCR REACTION (without necessarily requiring an agarose gel run)**

# Real-Time PCR Chemistries

Strategies to follow PCR product generation

SYBR<sup>®</sup> Green I dye

Binds double  
stranded DNA

Fluorogenic 5'  
Nuclease Assay

Uses a TaqMan<sup>®</sup> probe

## 2. Real-Time PCR chemistry based on Fluorogenic 5' Nuclease assay

Classic PCR setup with addition of amplicon-specific, modified ssDNA oligonucleotide

**FRET:**  
**Fluorescence Resonance**  
**Energy Transfer**

### **Taqman probe:**

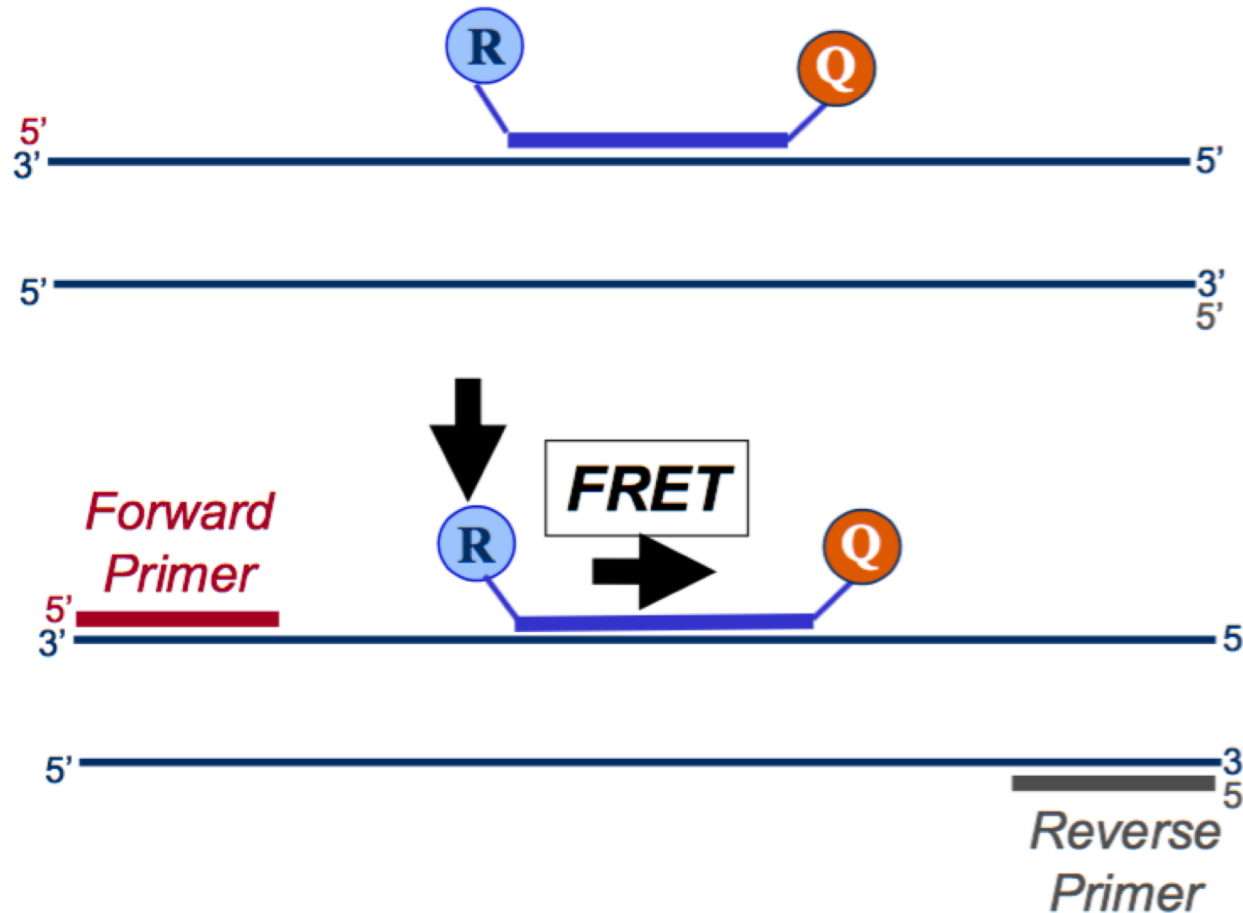

- Oligonucleotide
- PCR amplicon site specific
- Hybridizes with one strand of the PCR product
- Carries a fluorophor (R)
- Carries a Quencher that absorbes light emitted from fluorophor = "FRET"

**Important: FRET only works when Q is in close proximity to R**

## 2. Real-Time PCR Chemistries based on Fluorogenic 5' Nuclease assay

For example:  
Cycle 5 during PCR

- Denaturation at 95°C
- Annealing of PCR primers and Taqman probe

**\*FRET= Fluorescence Resonance Energy Transfer**

## 2. Real-Time PCR Chemistries based on Fluorogenic 5' Nuclease assay

Displacement during  
Polymerization

- DNA SYNTHESIS BY Taq  
polymerase

Cleavage

Taq has 5' → 3' exonuclease  
activity:  
Taqman probes degraded

Loss of FRET: light from R is not checked and can be detected in “real-time” during PCR  
Fluorescence increases with every cycle of PCR until reaching saturation in PCR plateau phase

## 2. Real-Time PCR Chemistries based on Fluorogenic 5' Nuclease assay

Displacement during  
Polymerization

- DNA SYNTHESIS BY Taq  
polymerase

Cleavage

Taq has 5' → 3' exonuclease  
activity:  
Taqman probe es degraded

ADVANTAGE:

HIGHLY SPECIFIC DETECTION OF AMPLIFIED DNA REGIONS:

1. Sequence specific PCR primers for PCR
2. **Amplicon specific DNA probe enables selective detection of region of interest!!!**

# Basics of real-time PCR measurements

## AMPLIFICATION BLOT

## Quantitative information

# **Let's compare semiquantitative PCR and quantitative PCR**

## **Example: gene expression analysis**

- **Semi-quantitative PCR and gene expression analysis**
- **Technical details on quantitative PCR**
- **Quantitative PCR and quantitative gene expression analysis**

# Analysis of quantitative RT-PCR data

## AMPLIFICATION BLOT

Quantitative information: number of template molecules decides at what cycle number exponential amplification is starting

# Terminology of amplification blots

## Terminology Baseline:

The initial cycles prior to any detectable amplification, in which there is little change in fluorescent signal.

2 parallel PCR reactions shown in blot:  
BLUE: PCR with template  
RED: PCR without template (negative control)

$R_n$ : reporter signal obtained from detector

# Terminology of amplification blots

## Threshold:

Level at which fluorescence is detected in reactions during the exponential phase of PCR

# Terminology of amplification blots

$\Delta R_n$ : Normalized reporter signal minus background (baseline level).

# Terminology of amplification blots

## Cycle Threshold ( $C_T$ ):

The cycle (point in time) at which the PCR product crosses the threshold of detection.

**$C_t$  VALUE:** Most important value for the analysis of real-time PCR data

**$C_t$  = threshold cycle:** è il ciclo della reazione di amplificazione in cui il segnale di fluorescenza del campione è maggiore rispetto a quello della Threshold

# Terminology of amplification blots

WITH EVERY CYCLE OF PCR, THE AMOUNT OF AMPLIFIED DNA DOUBLES - Theoretically

$$Y = N (1+E)^n$$

Y = resa di amplificazione/amount amplified

N = numero di molecole di DNA di partenza (number of starting DNA molecules)

E = efficienza di reazione (efficiency of reaction)

n = numero di cicli di amplificazione (number of PCR cycles)

The amount of initial DNA is reverse proportional to the number of cycles required to overcome the threshold (arrive at Ct)

Sample 1 (duplicate 1)  $C_t=26,2$   
Sample 1 (duplicate 2)

Sample 2 (duplicate 1)  $C_t=28,0$   
Sample 2 (duplicate 2)

Sample 3 (duplicate 1)  $C_t=28,5$   
Sample 3 (duplicate 2)

Sample 4 (duplicate 1)  $C_t=30,5$   
Sample 4 (duplicate 2)

Number of target DNA molecules in different samples

# Basics for the analysis of real-time PCR data: $C_t$ and $\Delta C_t$

Same primer pairs and reagents used

Sample 1 (duplicate 1)  $C_t=26,2$   
Sample 1 (duplicate 2)

Sample 2 (duplicate 1)  $C_t=28,0$   
Sample 2 (duplicate 2)

Sample 3 (duplicate 1)  $C_t=28,5$   
Sample 3 (duplicate 2)

Sample 4 (duplicate 1)  $C_t=30,5$   
Sample 4 (duplicate 2)

Amount of  
DNA of  
interest in  
different  
samples

Fold change sample 3 to sample 4 =

$$2^{\Delta C_t}$$

$$2^2=4$$

$C_t$  (sample 4) appears 2 cycles later than  $C_t$  (sample 3)  
→ note: in every cycle of PCR the amount of amplified DNA doubles → 2 cycles difference =

**concentration of target DNA is 4 times lower in sample 4 compared to sample 3**

# Analysis of real-time PCR data: $C_t$ and $\Delta C_t$

## Types of Quantitation Assays

```
graph TD; A[Types of Quantitation Assays] --> B[Absolute quantitation]; A --> C[Relative quantitation];
```

**Absolute quantitation**

**Relative quantitation**

# Analysis of real-time PCR data

## Types of Quantitation Assays

```
graph TD; A[Types of Quantitation Assays] --> B[Absolute quantitation]; A --> C[Relative quantitation];
```

### Absolute quantitation

### Relative quantitation

*Provides absolute measurement of starting copy number*

- **Requires standards of known quantity (Mol or ng)**
- e.g. Forensic science: Is there DNA and how much DNA (copy number) is there for forensics purposes
- e.g. Diagnostics: Virus titer in blood: is there virus DNA and how much is there?

# Basics for the analysis of real-time PCR data - Quantitative PCR

## Types of Quantitation Assays

Absolute quantitation

Relative quantitation

## Quantitative PCR

### ABSOLUTE QUANTITATION

Example: determine the number of virus molecules in blood of patient:

- Prepare DNA from a defined volume of blood (for example 200ul)
- Prepare Standard: serial dilution of target DNA (i.e. relevant segment of viral DNA cloned into a plasmid) concentration is known
- Run PCR with specific primer pairs (in same plate standards and patient sample)
- Analyse amplification blot

C<sub>T</sub>s derived from real-time PCR using and increased copy number of target site:  
PCR TARGET REGION MUST BE AVAILABLE (for example cloned into a plasmid)  
**DIFFERENT DILLUTIONS OF TEMPLATE ARE USED FOR PCR TO GENERATE A STANDARD CURVE**

Biological sample with unknown copynumber of PCR target site

# Basics for the analysis of real-time PCR data - Quantitative PCR

$C_t$  of all standards are used in linear regression analysis (x-axis: log ng; y-axis:  $C_t$  value)

$$y = -2.9966x + 15.311$$

x = ng of experimental sample

$C_t$  of Biological sample = 20

$$20 = -2.9966x + 15.311$$

$$x = (20 - 15.311) / -2.9966$$

$$x = -1.5647 \log ng$$

$$x = 10^{-1.5647} ng$$

$$x = 0.02724 ng = 2.7 \times 10^{-2} ng$$

# Basics for the analysis of real-time PCR data - Quantitative RT-PCR (for gene expression analysis)

## Types of Quantitation Assays

```
graph TD; A[Types of Quantitation Assays] --> B[Absolute quantitation]; A --> C[Relative quantitation]
```

**Absolute quantitation**

**Relative quantitation**

### RELATIVE QUANTITATION

**Sample 1: Control**

**Sample 2: Experimental alteration  
(drug treatment, knock-down, etc..)**

**Compare situation Sample 1 with that  
of Sample 2)**

**Provides accurate discrimination between relative  
amounts of starting material**

- e.g. Comparing expression levels of wildtype vs. mutated alleles
- e.g. **Comparing expression levels of a gene across different tissues or  
between different biological conditions**
- e.g. Validating array results

# Basics for the analysis of real-time PCR data - Quantitative RT-PCR (for gene expression analysis)

Cells stimulated for several hours (0-48h) with retinoic acid (retinoic acid binds a transcription factor that targets gene promoters)

## RELATIVE QUANTITATION

Sample 1: Control

Sample 1, 2,...: Experimental alteration (drug treatment, knock-down, etc..)

## QUESTION:

How are genes of interest (for example Hox A gene) regulated during this time

GENE OF INTEREST  
(i.e. Hox gene)

REFERENCE GENE  
THAT IS NOT  
AFFECTED BY  
RETINOIC ACID  
TREATMENT

Used prepared cDNA for real-time PCR to determine the levels of mRNAs of interest in different experimental samples. Note that the mRNAs composition in biological difference changes, due to the retinoic acid treatment

# Semi-quantitative PCR and gene expression analysis

## Gene expression analysis

Conversion of mRNA to complementary DNA (cDNA) using primers and reverse

transcriptase

Genes that are expressed at high levels result high number of cDNA molecules

Genes that are expressed at low levels

Result low number of cDNA molecules

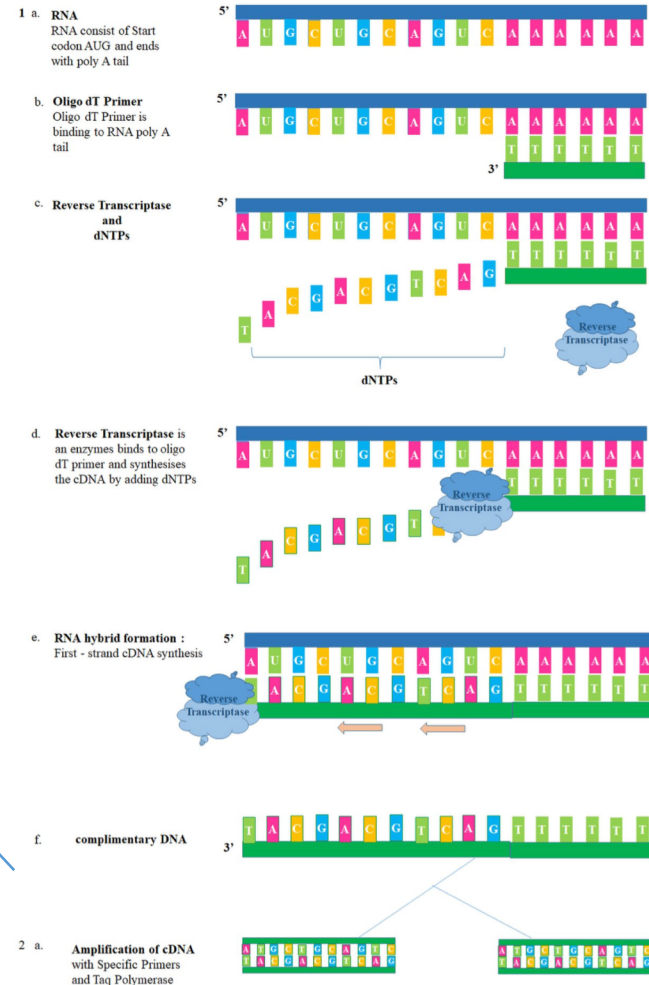

→ Different template number in PCR reactions

→ Information on gene expression levels

## Reverse transcriptase (obtained from retroviruses)

### 4.8 Reverse transcription polymerase chain reaction (RT-PCR)

In RT-PCR, The RNA population is converted to cDNA by reverse transcription (RT), and then the cDNA is amplified by the polymerase chain reaction. The cDNA amplification step provides opportunities to further study the original RNA species, even when they are limited in amount or expressed in low abundance. Common applications of RT-PCR include detection of expressed genes, examination of transcript variants, and generation of cDNA templates for cloning and sequencing.

Oligo-T primers or random oligonucleotide primers (9-mers) are used to prime reverse transcription of mRNA

Complementary DNA (cDNA) synthesis

RNA:cDNA hybrid

Degradation of RNA by RNaseH activity of reverse transcriptase

cDNA used as PCR template

# Basics for the analysis of real-time PCR data - Quantitative RT-PCR (for gene expression analysis)

Cells stimulated for several hours (0-48h) with retinoic acid

## RELATIVE QUANTITATION

### REFERENCE GENE:

- no altered expression in relevant biological
- normally expressed at high levels
- **Serves to control of sample quantity**
- **Serves to control for pipetting errors**
- Examples: 18S rRNA, GAPDH,  $\beta$ -actin, tubulin, RNA polymerase II, histone H3

# Basics for the analysis of real-time PCR data: $C_t$ and $\Delta C_t$ and $\Delta\Delta C_t$

Gene	t=0	t=12	t=24	t=36
$C_t$ Reference	15	15	15	15
$C_t$ Hox gene	30	28	26	24
$\Delta C_t$	15	13	11	9

$\Delta\Delta C_t$

$\Delta\Delta C_t$

$2^{\Delta\Delta C_t}$

$15-13=2$  (cicli)

$2^2=4$

$15-11=4$

$2^4=16$

$15-9=6$

$2^6=64$

Higher  
expression  
when  
compared to  
t=0

fold expression change of  
Hox gene  $\Delta\Delta C_t$  (t=0) set  
"1"

0

12

24

36

time

# Basics for the analysis of real-time PCR data: $C_t$ and $\Delta C_t$ and $\Delta\Delta C_t$

Gene	t=0	t=12	t=24	t=36
$C_t$ Reference	15	15	17	15
$C_t$ Hox gene	30	28	28	24
$\Delta C_t$	15	13	11	9

We assume a scenario where in one of the samples was not processed correctly during RNA preparation of cDNA synthesis:

t=24: reduced cDNA levels in sample ( $C_t$  of reference =17; not 15), when compared to t=0, 12,36

→ higher  $C_t$  for reference **but also Hox gene**

→ Thus, delta  $C_t$  remains unchanged

→ REFERENCE GENE SERVES TO COMPENSATE DIFFERENT EFFICIENCY OF UPSTREAM STEPS

$\Delta\Delta C_t$		15-13=2 (cicli)	15-11= 4	15-9=6
$2^{\Delta\Delta C_t}$	1	$2^2=4$	$2^4=16$	$2^6=64$

# What is Real-Time PCR used for?

**Real-Time PCR has become a cornerstone of molecular biology:**

- **Gene expression analysis**
  - Cancer research, developmental biology, genetic disease....
  - Functional experiments: i.e. knock down of relevant gene → alteration of gene expression; i.e. change of condition of environment → alteration of gene expression
- **Disease diagnosis and management**
  - Viral quantification
- **Food testing**
  - Percent GMO food
- **Animal and plant breeding**
  - Gene copy number

**For all applications that require the quantification of RNA/DNA sequences**
